45. Climbing O.

HE bill in this genus is strait, conic, very sharp-pointed; edges cultrated, inclining inwards; mandibles of equal length.

Nostrils small, placed at the base of the bill, and partly covered.

Tongue divided at the end.

Toes three forward, one backward; the middle joined near the base to the outmost one.

These birds are inhabitants of America, except in a few inflances; are a noisy, gregarious, frugivorous, granivorous, and voracious race, very numerous, and often have pensile nests. To these definitions from the Genera of Birds, I shall not add any thing more here, the manners of each being noted in their proper places.

+ BLACK AND YELLOW O.

DESCRIPTION.

pale yellow: irides blue: general colour of the plumage black: on the middle of the wing is a large fpot, of a golden yellow: lower part of the back, rump, belly, and vent, yellow: thighs in some yellow, in others black: legs and claws black.

Jupujuba, seu Japu, Bras. Raii Syn. p. 46. No 7. Brasilian Jupujuba, or Japu of Marcgrave, Will. orn. p. 142.

VAR. A.

HIS feems not to differ materially from the last, except in the tail, the whole of which is black on the upper part, except the outer feather, which is yellow at the base; but beneath half yellow, half black: the irides of a sapphire-colour: and the tongue blue.

Description.

Black and yellow Daw of Brafil, Edw. p. 319.

VAR. B

THIS feems a trifle bigger: has a purplish lustre in the black plumage: and has some of the yellow feathers, which compose the spot on the wings, tipped with black.

DESCRIPTION:

These birds are met with in *Brasil* and *Cayenne*, and the warmer parts of *South America*; and are the fabricators of those curious nests, met with in the cabinets of the curious. These are in the shape of an alembic, about one foot and a half in length, composed of dry grass and horse-hair, or hogs bristles, mixed *: the bottom,

Place and Manners.

* These nests are in part composed of what is called old-man's-beard, which is common in the south parts of America, and the West-India Islands, and which, at first view, may easily be mistaken for borse-bair; and is the Tillandsia asserted. Lin.

The above bird may possibly prove to be the *Petite Pie* of *Fermin*; but he gives no description of it, further than that its colours are prettily diversified, and yellow from the middle of the back to the rump. He says, that it easily learns to talk a number of words, and ordinarily makes the nest on the tops of high trees, laying at each time six or eight eggs, spotted with black: lives on

infects,

3 H 2

bottom, for one foot upwards, is hollow, like a purse; the remainder, or upper part of it, for half a foot, being solid; and hangs by the top, on the extremity of a branch of a tree. They often build near houses; and on one tree there have been known above four hundred of these nests: and many pairs have been known to hatch and bring up three broods in a year.

REDRUMPED
O.

Oriolus hæmorrhous, Lin. Syst. i. p. 161. N° 5. Le Cassique rouge, Bris. orn. ii. p. 98. N° 13. pl. 8. f. z. du Bresil, ou le Jupuba, Bust. ois. iii. p. 238.—Pl. enl. 482.

DESCRIPTION.

ENGTH eleven inches. Bill an inch and a quarter long, of a brimftone-colour, thick at the base, and goes far back into the forehead, where it is rounded, and bare of feathers: the general colour of the plumage is black: the lower part of the back, the rump, upper and lower tail coverts, fine crimson: the wings and tail dusky black: legs and claws black.

PLACE.

Inhabits Brafil and Cayenne, where it is called Cassique.

2. Var. A.

Cassique brun, Orn. de Salerne, p. 112.

DESCRIPTION.

THE whole body of this is brown, inclining to black: rump and upper part of the tail the colour of wine-lees: under the tail light yellow.

infects, and all forts of small birds, when it can catch them, and also their eggs: when it advances, it is by hopping, always flirting its tail. It is bold enough to attack birds of prey, as well as leverets, and other such game. Descripted Survinam, vol. ii. p. 167.

This

This is found at Guiana, where it is known by the name of Quiacaïgou. It is faid to frequent thick shady places, near water, and to squeak like a Jay.

PLACES

Le Cassique huppé de Cayenne, Buf. oif. iii. p. 241.—Pl. enl. 344. Xanthornus maximus, Pallas Spic. vi. p. 1. & seq. t. 1. Lev. Mus.

CRESTED O.

SIZE of a Magpie: length eighteen inches. The bill is strong, two inches long, of a dirty yellow, bare, and somewhat gibbous at the base, where it is rounded and convex: the nostrils are placed in a surrow: tongue jagged: irides blue: the head is surnished with a crest, which can be elevated at the will of the bird: the body is black as far as the middle, but the lower half, rump, and vent, deep chestnut: the wings are black: the two middle tail feathers the same; the others yellow: the shape of the tail cuneiform: the legs are black.

DESCRIPTION.

Pallas fays the irides are yellow: the body dull black: the vent ferruginous: the wings reach to the middle of the tail; the two middle feathers of which are shorter than the adjoining ones.

Pallas's specimen came from Surinam, where I am informed these birds are common.

PLACE.

VAR. A.

HAVE now before me a most beautiful specimen of this bird, which is full twenty inches in length. The bill two inches and a quarter long, yellow, and tipped with orange, shaped as in the other: the head is not only crested, but has likewise two slender

DESCRIPTION.

9

feathers

feathers of two inches and a quarter in length, which fpring from the hind head, and hang down behind: the plumage in general is olive, with a cast of orange: the lower part of the back, rump, belly, and vent, chestnut: tail rounded; the two middle feathers shorter than the next, and chestnut; the others wholly yellow, except the outer one, which has the outer web dusky the whole length: legs black: toes divided to the bottom.

BLACE.

This is in the collection of Capt. Davies, who received it from South America; and I have lately feen a fecond, which came from Cayenne.

WAR. B.

Le Cassique vert de Cayenne, Buf. ois. p. 240.—Pl. enl. 328.

Lev. Mus.

DESCRIPTION.

HIS bird measures fourteen inches in length, and eighteen or nineteen in breadth. The bill is red: all the forward parts, taking in the wing coverts, are green; the hinder parts chestnut: quills black: tail shaped as the others; the two middle feathers black; the others yellow: legs black.

PLACE.

Inhabits Cayenne. The bird referred to in the Leverian Mufeum was of an olive green, but answered as to other things.

WHITE-HEADED O.

DESCRIPTION.

Le Cassique de la Louisiane, Buf. ois. iii. p. 242.—Pl. enl. 646. White-headed Oriole, Am. Zool. No

ENGTH ten inches. Bill black, a little bent, one inch in length: the head, neck, belly, and rump, are white: quills and tail of a changeable violet, bordered with white; the rest of

the

the plumage mixed white and black: the tail is somewhat cuneiform, and the wings, when closed, reach to about the middle of it: the legs are lead-colour.

This species inhabits Louisiana, and other parts of North America.

PLACE.

RICE O. Description.

ENGTH nine inches. Bill an inch and a half long, black, flout, sharp, and a very little bent at the tip; slat on the top towards the base, where it is rounded, and passes far back on the forehead, and is there a little protuberant, like the former ones: the general colour of the plumage is black: the head, neck, and breast, have a fine gloss of purple: the whole wing, and rest of the body, black: the tail consists of twelve feathers, and was five inches in length, but had been longer, as the ends were spoiled: the wings reach a little beyond the insertion of the tail: the legs were wanting.

I found this in the collection of Miss Blomefield; it was supposed to come from Cayenne. A label annexed gave it the name of Oiseau de Ris, de grosse espece.

Banana bird from Jamaica, Albin. ii. pl. 40.—Large Do, Brown. Jam. 447.

Lev. Mus.

DESCRIPTION.

SIZE of a Blackbird: length nine inches and a half. The bill in fome is hoary, in others black, with a brown base: skin round the eyes naked and blueish: irides yellowish: general colour of the plumage orange yellow: head, throat, lower part of the neck, and middle of the back, fine black: wings black: with two oblique bands of white: tail black: legs in some black, in others of a lead-colour, and sometimes greyish white.

Place and Manners.

This species is found in Carolina; from thence to Brasil, and in all the Caribbee Islands. In Jamaica, Sloane tells us, it is common; and that it feeds on insects, and has the same custom in hopping about as the Magpie. Albin mentions, that its actions resemble a Starling. "I have seen," says he, "four or sive of them set upon, and kill, a large bird or sowl; and when dead, each one, according to his place of mastership, choose his part." Kept in America in houses, to kill insects. In its wild state very agile and wrathful, and so bold as to attack men: will find out and destroy chrysalids already spun up; into which it thrusts its bill, and tearing open the cases, takes out the chrysalis; but I am told is very docile when kept tame.

But

But the most curious part of their history is the nest, which is made in the form of a cylinder, and suspended to the end of the utmost twig of a tree, of which one sometimes sees a great many on one tree, and that not far from the houses. This precaution, no doubt, is to prevent the rapine of snakes, and other animals, which would otherwise destroy the young birds.

NEST.

Le Troupiale du Mexique, *Bris. orn.* ii. p. 88. N° 2. L'Acolchi de Séba, *Buf. ois.* iii. p. 206. Avis Americana de Acolchichi nigro lutea, *Seba*, vol. i. t. 54. f. 4.

MEXICAN O.

SIZE of the last. The bill is pretty long, and of a yellow colour: the head, throat, quills, and tail, are black: neck, back, rump, breast, belly, sides, thighs, and both tail coverts, of a fine yellow: lesser wing coverts black; the greater tipped with yellow.

Description.

Inhabits Mexico.

PLACE.

Le Troupiale à queue annelée, Brif. orn. ii. p. 89. N° 3. L'Arc-en-queue, Buf. ois. iii. p. 207. Avis Ocotzinitzcan, Columbæ magn. Seba, vol. i. 97. pl. 63. f. 3.

RING-TAILED

SIZE of a Pigeon. Bill yellow, a trifle bent at the point: head, throat, and neck, black; the rest of the body yellow, shaded with a deeper yellow both on the upper and lower tail and lesser wing coverts: greater wing coverts and quills blackish, edged with pale yellow: the tail yellow; each feather marked with a broad transverse blackish band, making, when the tail is

Description.

3 I

fpread

426

fpread open, a crescent, with the concave part towards the body : the legs grey.

PLACE.

Inhabits America, where Seba observes, that it is accounted a bird of prey.

BRASILIAN O. Le Troupiale du Bressl, Bris. orn. ii. p. 93. Small yellow and brown bird, Sloan. Jam. 309. No 43.

DESCRIPTION ..

ENGTH four inches. Bill round, nearly strait, half an inche long: head and back light brown, spotted with black: tail an inch and a half long, and brown, as well as the wings, which are whitish at the end: about the eyes, throat, sides of the neck, and tail coverts, are yellow: breast the same, spotted with brown: belly white: legs brown, an inch and a quarter long: toes yellow.

PLACE.

Inhabits famaica: common about the town of St. Jago, where it is often feen among the bushes.

JAPACANI O: Le Troupiale du Bresil, Bris. orn. ii. p. 93. Japacani, Bus. ois. iii. p. 208.—Raii Syn. p. 84. No 12.—Will. orn. p. 240s.

Description.

SIZE of a Starling: length eight inches. The bill is long, pointed, a little curved, and black: irides gold-colour: head blackish: hind part of the neck, back, wings, and rump, varied with black and light brown: tail blackish above, spotted with white beneath: breast, belly, and thighs, mixed white and yellow, with transverse black lines: legs dusky: claws sharp and black.

These two species are made but one by Brisson; but the sizes

are

are fo different, that it is impossible to reconcile them, the last being double the fize of the first.

Brisson has copied his description of the Jacapani from Marcgrave, as well as the fize, not attending to the fize of Sloane's bird, though the colours somewhat agree.

Le Troupiale de la Nouvelle Espagne, Bris. orn. ii. p. 95. N° 10. See le Xochitol & Costototl, Bus. ois. iii. p. 210.

NEW SPAIN

SIZE of a Starling. The head, throat, neck, back, rump, and upper tail coverts, are black: breaft, belly, fides, and under tail coverts, faffron-colour, mixed with black: thighs black: wings beneath cinereous, mixed with black and white: tail faffron-colour, varied with black. The young birds are yellow, except the tips of the wings, which are black.

Description's

Inhabits New Spain.

PLACE.

Le Troupiale gris de la N. Bîpagne, Bris. orn. ii. p. 96. No 11. Le Tocolin, Bus. ois. iii. p. 213.

GREY O.

SIZE of a Starling. The body is agreeably variegated with black and yellow, except the back, thighs, and belly, which are ash-coloured.

DESCRIPTION.

This inhabits the forests of *New Spain*, in which it makes its nest, and brings up its young. It does not fing. The sless is accounted good eating.

PLACE.

Zool. N°

Br. Muf. Lev. Muf.

DESCRIPTIONS.

SIZE of a Starling: length from eight to nine inches. The bill is black, and almost an inch in length: irides white: the whole bird is of a deep black, except the shoulders of the wings, which are of a deep red: the legs are black.

FEMALE.

The female is faid to differ in being smaller; in having a mixture of grey in its feathers, and the red on the wings more obscure.

PLACE AND MANNERS. This is an American bird, and peculiar to that continent: found at Mexico, the Carolinas, Virginia, and as far as New York. Catefby mentions their building the neft, woven together among the reeds, in Carolina and Virginia; but I am informed by others, that they build between the forks of trees, three or four feet from the ground, along with other birds, in the fwamps, which are feldom penetrable by man. This method of building is likewise mentioned by Fernandez.

In winter only they are met with in Louisiana*, and sometimes come in such immense slocks, that at one draw of the net frequently three hundred or more are taken. These nets are spread in some bare smooth path at the side of a wood, and the place

* Du Pratz, vol. ii. p. 135;

being strewed with rice, &c. it often happens that so many are caught that they are obliged to knock most of them on the head on the spot, otherwise it would be impossible to secure so vast a number.

Their common name in America is Maize-thief, which they have gained from their destroying that grain; but they do not attack it except while green, when they peck an hole in the side, by which means the rain gets in and spoils the ear. I have had it hinted to me, that it is in search of insects that the bird does this, more than for the sake of the grain; but to this matter I can say nothing.

Besides the above, other birds inhabit the same places, which have every feather, even the red ones, margined with white, many of which I have feen. Some tell me that they are young ones; others, that they are a distinct species, which do not keep company with the others; and, not a few, that they are the females; but what has been shewn me for a female, by an intelligent obferver, had no red on the wing, yet was margined with white like the others. My own opinion is, that neither fex gains the full black till mature age, and that the female never does. I observe among the mottled ones, fome which have the red on the wing almost compleat; others, the same, but paler in colour; others again, with the rudiment only; and lastly, a few with not the least trace of it. I observe likewise, that in all the mottled ones. there is an obscure pale streak over the eye, which is not visible: in the full black ones. The above want investigation; and it is to be hoped that some future curious observer will take some pains to fet us to rights in this matter.

RED-BREASTED O. Troupiale de Cayenne, Pl. enl. 236. No 2.—Buf. oif. iii. p. 218.

Merula Indica pectore cinnabarino, an Jacapu Marcg.? Raii Syn. p. 67.

Red-breasted Indian Blackbird, Will. orn. p. 194. No y. Mocking-bird of Guiana, Bancroft's Guiana, p. 177.

Lev. Mus.

DESCRIPTION.

I ESS than a Blackbird: length feven inches. The colour wholly black, except the chin, fore part of the neck, and the breast, which are of a fine deep red: the upper edge of the wing is also red.

PLACE AND MANNERS. This is found in Guiana and Cayenne.

Bancroft's bird had the top of the head likewise red; and the bill of his was slesh-colour; yet I make no doubt of its being a variety of the above-described. The nests of these are built of hay, &c. and are cylindrical, being twelve or sisteen inches in circumference. They are seen depending from the high branches of the tallest trees, and are wasted to and fro by the wind; on which account their great length is necessary, that the bird may not be thrown out by every gust of wind, which would otherwise happen. Their note is sweet and harmonious; but they imitate those of many other birds.

:GUIANA O. Oriolus Guianensis, Lin. Syst. i. p. 162. N° 9? Le Tropiale de la Guiane, Bris. orn. ii. p. 107. N° 18. pl. 11. f. 1.—Bus. ois. iii. p. 218.—Pl. enl. 536.

DESCRIPTION.

SIZE of a Thrush: length seven inches and a quarter. The bill brownish: general colour of the plumage black; each feather margined

margined with grey; but the under part, from the chin to the belly, between the legs, and the lower wing coverts, red: tail fomewhat friated with grey: legs and claws brown.

Inhabits Guiana. I much suspect this to be the semale of the Iast, or a young bird, as was hinted of the former: the several differences in particular birds are kept up as in that species. I have seen some of these with the breast only red, and in one specimen the breast not red, with a sew red dashes on the chin; but in all I have seen the shoulders were red. Bussion supposes both this and the red-winged Oriole, with all the varieties of both, to be the same bird. I cannot at present assent to it, as I think the make and shape of the birds seem to differ on comparison. It is future observation alone that must confirm the matter.

Le Baltimore, Bris. orn. ii. p. 109. N° 19. pl. 12. f. 1.—Buf. cis. iii. p. 231.—Pl. enl. 506. f. 1.

Baltimore Bird, Catesb. Car. i. pl. 48.—Am. Zool. N°

Br. Mus. Lev. Mus.

DESCRIPTION.

LENGTH feven inches. Bill lead-colour: head, neck, and upper part of the body, black: the rest of the body orange: the bend of the wing and lesser wing coverts are orange: greater coverts and quills black; the first tipped with white, making a white bar on the wing; the last margined with white: the two middle seathers of the tail are black; the sour outer seathers are

orange from the middle to the tips; and the two next just tipped with orange: legs and claws black.

The female, according to Buffon, has all the fore parts of a fine black, like the male: tail the fame: wing coverts and quills blackish: and those parts, which are of a fine orange in the male, are in the female of a dull red.

Baltimore Birds are found in many parts of America, the northern parts of which they occupy in fummer, being seen sometimes as far as Montreal, in Canada, where they come in May; returning southward in the winter, which accounts for their being seen in Maryland and Virginia at that time. They make the nest of a soft downy matter, in the shape of a purse, tying it with threads to the very extreme forked twigs of the tulip, plane, and biccory trees; in which they lay their eggs, and rear their young, free from depredators of all kinds.

They are called *Fire-birds* by the country people; and indeed, when in high plumage, their motions from branch to branch not unaptly refemble a flash of fire.

FEMALES

PLACE AND MANNERS.

Oriolus spurius, Lin. Syst. i. p. 162. No 11. Le Baltimore Bastard, Bris. orn. ii. p. 111. No 20. pl. 10. f. 3.—Buf. ois. iii. No 233.—Pl. enl. 506. f. 2. Bastard Baltimore, Catesb. Car. i. pl. 49.—Amer. Zool. No

+ BASTARD BALTIMORE O.

SIZE of the true Baltimore, but measures a trifle less in length.
Bill lead-colour: forehead and cheeks black and yellowish
mixed: hind head and nape olive grey, marked with a few spots
of black: the upper part of the back the same, but more dull;
the lower part of the back, the rump, fore part of the neck,
breast,

Description.

breaft, belly, fides, thighs, upper and lower tail coverts, and under the wings, orange yellow, brightest on the breaft and tail coverts: lesser wing coverts deep brown; the greater the same, tipped with dirty yellowish white: quills brown, bordered on both edges with whitish: the two middle tail feathers are olive, then blackish, marked at the end with a longitudinal yellowish spot; the next on each side olive and black, consusedly mixed; and the sour outer ones of a yellowish olive: legs and claws blueish.

A bird of this kind, shewn to me as a semale, had the chin black: the upper part of the body olive brown: on the wings two bars of white, formed by the tips of the coverts: quills edged with whitish: and the tail dusky: the under parts of the body olive yellow: bill and legs blueish. I have likewise one of this last described, which came from North America; but in my bird the chin was only brown, like the upper parts of the body, and the colours all paler than in the other*.

There feems to me much confusion and uncertainty in the true and bastard Baltimores and their females; most likely at last they may, the whole of them, turn out mere varieties of one single species, all of them, perhaps, referable to one or other sex of the true Baltimore, in the different stages of life.

^{*} It very much resembled one figured in the Planches enluminées, which is said to come from the Cape of Good Hope. Pl. enl. 607. f. 2.

Le Cap-more, Buf. oif. iii. p. 226.

Troupiale mâle du Senegal, Pl. enl. 375.

femelle, 376.

WEEVER O.

Description.

SIZE of the Golden Thrush, but the wings shorter in proportion. The bill horn-colour: irides orange: the head brown, appearing very glossy in the sun, as if gilded: the colour of the rest of the plumage for the most part yellow, inclining more or less to orange: quills and tail blackish, edged with orange: legs reddish. Another had the head, chin, sides, and fore part of the neck and breast, yellow: back part of the neck brown: wings and tail dusky, edged with yellow: belly and thighs whitish: legs as in the first bird.

These came together from Senegal, and were at first thought to be male and female; but after keeping two years, that which was thought to be the female, became of the same plumage as the other, by gaining the brown head: but in both birds the head lost its dark colour, and became yellow, every autumn, regaining it in the spring.

In the cage where these birds were kept, it was observed, that they entwined some of the stalks of the pimpernel, with which they were fed, in the wires: as this seemed to shew a disposition of making a nest, some rush-stalks were put into the cage; on which they presently made a nest large enough to hide one of them at least; but it was as often deranged as made, the work of one day being spoiled the next; serving to shew that the sabrication of the nest in a state of nature was the work of both male and semale, and in all probability is simished by the last. They had a sharp but lively note.

aining

MANNERS.

PLACE.

3 K 2

A friend

A friend of mine described a bird to me, which he saw at a house of an acquaintance, which seemed to be this very bird. By accident having got a bit of sewing silk, it wove it among the wires of the cage; on which, more being put to it, it interlaced the whole very confusedly, so as to hinder most part of that side of the cage from being seen through. It was found to prefer green and yellow to any other coloured silk.

BONANA O. Oriolus Bonana, Lin. Syft. i. p. 162. Nº 12.

Xochitototl altera, Raii Syn. p. 167. N° 12?

Bonana Bird, Brown, Jam. p. 477.

Lev. Mus.

Description.

ENGTH feven inches. Bill ten lines long, and black; base of the lower mandible grey: the head, neck, and breast, chestnut: upper part of the back velvet black; lower part, rump, belly, thighs, and under the wings, a deep orange red: vent the same, tipped with chestnut: greater wing coverts, quills, and tail, black: legs and claws grey.

FEMALE.

The female differs in being less bright.

PLACE.

These birds are found in *Martinico*, Jamaica, and other West India islands. It builds a nest of a curious construction, made of sibres and leaves, exactly in the shape of the fourth part of a globe, sewed with great art under a leaf of a banana plant, in such a manner that the leaf makes one side to the nest.

Icerus-

Icterus minor nidum suspendens, Watchy Picket, Spanish Nightingale, American Hang-nest, Raii Syn. p. 184.—Sloan. Jam. p. 300. N° 17. pl. 258. f. 3.

HANG-NEST O.

WITH just reason it may be doubted whether the Watchy Picket of Sloane be the same bird as the last, though Brisson has joined it to his synonyms; I have therefore thought right to separate them, giving Sloane's own description.

DESCRIPTION.

The bill, he fays, is white, furrounded by a black line: crown of the head, neck, back, and tail, reddish brown: wings deeper, intermixed with white, and a black line on the middle of the neck; the sides of which, the breast, and belly, is of a seuillemot-colour.

A variety of this had the back more yellow: the breast and belly of a bright yellow: and the bill black. This, he observes, is common in the woods, and sings not unpleasantly; makes its nest of stalks, or inward hairs of old man's beard, which is like horse-hair, on high trees. Such nests are not unfrequently seen on the further twigs of high trees, when the leaves are fallen off which hide them. The two opposite methods of constructing, as well as placing, the nest, cannot surely belong to one bird.

Le Carouge de Cayenne, Pl. enl. 607. f. 1. Bastard Baltimore semale, Cat. Car. pl. 49. lowest figure. CHESTNUT AND BLACK O.

ENGTH fix inches: Bill eight lines, and blue black: the head, neck, breast, and to the middle of the back, are black: the lower part of the back, rump, and upper tail coverts, the belly.

DESCRIPTION.

belly, vent, and under tail coverts, are dull ferruginous: the lesser wing coverts are of this last colour: the greater coverts, quills, and tail, are black; but the secondaries are fringed on the outer edge with dusky white: the legs are blue black.

I have had my doubts whether this bird was at all allied to either the true or bastard Baltimore; though Catesty affirms it of the last, and Brisson supposes it of the first; and rather am inclined to think it a distinct species, for more reasons than one. The whole bird is less than either of them, and shorter: and bill somewhat different likewise. I am strengthened in this supposition, from seeing in the British Museum a bird called the other sex of this, and placed as such in the same case. This exactly corresponds in size and shape, bill and legs. The head and hind part of the neck variegated with dusky and greenish: chin and throat black: the breast chestnut red: the belly yellowish: quills and tail dusky with pale edges. Two of the above-described were likewise sent lately to Capt. Davies, for male and semale of the same species.

LESSER BONANA O. Oriolus Xanthorus, Lin. Syft. i. p. 162. Nº 13.

Le Carouge du Mexique, Brif. orn. ii. p. 118. Nº 23. pl. 11. f. 2.—Pl. enl. 5. f. 1.

Le petit Cul jaune de Cavenne. Buf. oil iii. p. 240.

Le petit Cul jaune de Cayenne, Buf. oif. iii. p. 247. Lesser Bonana Bird, Edw. pl. 243.

DESCRIPTION.

ENGTH feven inches and a half. Bill blackish: face even with the eyes: throat, quills, and tail, black: the rest of the body of a bright yellow: wing coverts black; most of them edged with white, as are the quills within, towards the base: legs and claws black.

In

In some of these which I received from Jamaica, the greater wing coverts were wholly white, forming a bar of white across the wing, and the yellow of the body inclining to olive.

Le Carouge de St. Domingue, Bris. orn. ii. p. 121. N° 25. pl. 12. f. 3.—

ST. DOMINGO O.

O.

ENGTH eight inches. General colour black, except a part of the leffer wing coverts, and the lower part of the belly and vent, which are yellow.

Buffon thinks this bird to be the female of the last.

These inhabit Mexico, Jamaica, and St. Domingo: at this last place they are called Demoiselles; at Jamaica, lesser Bonana-birds. Their note is much like that of the golden Thrush, with the sharpness of that of a Magpie. Like many of this genus, they suspend their nests, which are in the form of purses, at the extreme twigs of the branches of large trees, especially those which hang over a river. In these nests there are small partitions, in each of which there is a nest.

The birds are faid to be very artful, and difficult to be taken.

Shomburger, Edw. N° 85.

SIZE of a Lark: length fix inches. Bill dull flesh-colour: irides hazel: crown, back, and rump, rusous brown; beneath the same, but lighter: each feather, both above and beneath, (except the crown, which is plain) has a blackish spot in the middle

DESCRIPTION.

middle of each feather: lower part of the belly, thighs, and both tail coverts, light brown: fcapulars the fame, with a tinge of yellow: quills and tail blackish, with rusous brown edges: the cheeks and throat are black, which narrowing on each side of the neck, at last ends in a point on the lower part of the neck, just above the shoulders: legs slesh-colour: claws brown.

PLACE.

Inhabits Mexico. Mr. Edwards compares the colours of this bird to those of a Lark, and says the hind too is long.

VAR. A.

Le Tropiale tacheté de Cayenne, Buf. oif. iii. p. 223.-Pl. enl. 448. f. 1, 2.

MALE.

BUFFON makes this and the last varieties only. The male had the throat plain white: a streak of the same passed directly through the eye, between two other black ones parallel to it: the irides reddish orange. This bird had each feather black brown in the middle, bordered with orange on the wings, tail, and lower parts of the body; and with yellowish on the parts above.

FEMALE.

As to the *female*, the plumage is for the most part of a dingy yellow, blended with dirty white, giving it an unpleasing uniformity: the irides orange, as in the male.

PLACE.

These are likewise inhabitants of Cayenne.

GOLD-HEADED Oriolus chryrocephalus, Lin. Syst. i. p. 164. No 20. Le Carouge à tête jaune d'Amerique, Bris. orn. app. 38. t. 2. f. 2.

DESCRIPTION.

ENGTH eight inches. Bill black, a trifle bent: upper part of the head fine yellow: forehead, fides of the head, the neck, the back, rump, scapulars, breast, belly, upper part of the thighs,

thighs, and fides, shining black: lower part of the thighs yellow: upper, lesser, and lower tail coverts the same, but paler: the great tail coverts black: lesser wing coverts beneath pale yellow; greater ones cinereous, mixed with yellow and black; above, the lesser are sine yellow, the greater blackish: quills black, with the edges paler: tail blackish, rounded: legs lead-colour: claws blackish.

Inhabits America.

PLACE.

Pl. enl. 607. f. 2.

Le Carouge olive de la Louisiane, Buf. ois. iii. p. 251. Olive Oriole, Amer. Zool. No

DESCRIPTION.

ENGTH feven inches. Bill brown: colour of the plumage olive brown above, yellow beneath: upper part of the head olive grey: throat and fore part of the neck verging to orange: edge of the wing yellow: coverts brown, margined and tipped with olive green: quills brown, edged with olive: tail of this last colour: legs and claws brown.

PLACE.

Inhabits the Cape of Good Hope.

One of these, which came from the same place, at Sir J. Banks's, had the forehead, cheeks, and all beneath, yellow: the upper parts brown: wings and tail darker, edged with yellow.

Buffon fays, that he has received a bird of this fort from Loui-fiana, differing in having the throat black instead of orange, and inclining to olive throughout.

36. BLUE O. Le Carouge bleu, *Brif. orn.* ii. p. 125. N° 28. Small blue Jay, *Raii Syn.* p. 195. N° 11. pl. 1. f. 18.

DESCRIPTION.

BILL rufous: the whole plumage black, or ash-colour, except the head, wings, and tail, which are blue.

Inhabits

Inhabits Madras, and called by the Gentoos, Peach Caye.

PLACE.

Buffon will not have this ranked with the Orioles, as the shape of the bill is not mentioned; nor will the country it comes from, according to his opinion, admit of it, as he thinks that this genus is wholly confined to South America. To balance this, however, it is but right to give the opinion of Pallas, who, no doubt, has observed it minutely, when he says it is a true Xanthornus, though the smallest of its race*.

Fermin † mentions a bird not unlike this at Surinam. The bill pointed, black, the length of the finger: head and upper parts blue, to the beginning of the back: tail black: wings the fame; in the middle a long fpot of white parallel to their length: rest of the body sky blue: legs blueish. He says that it suspends the nest at the end of the branches of trees; and it is from this circumstance that I have ventured to place it here.

Le Troupiale noir, Bris. orn. ii. p. 103. No 15. pl. 10. f. 1.—Buf. ois. iii. p. 320.—Pl. enl. 534.

Br. Muf.

BLACK O.

SIZE of a Starling: the length more than nine inches. The bill is one inch long, and black: the whole plumage black and gloffy: legs black.

MALE.

The female is of a greenish brown: the bill and legs just as in the male: but the head, breast, and belly, inclining to ash-colour.

FEMALE.

• Contra Xanthornus verus est, quamvis in suo genere minutissimus & solo eyaneus, vigesimus octavus Brissonii. Pallas Spic. vi. p. 3. note (a).

446

PEACE:

Inhabits North America. At Capt. Davies's I saw one of these, which at first sight appeared of a different species. The plumage a brownish glossy black, but each feather margined with ferruginous brown, the quills and tail excepted, which were of a plain black colour. I have observed likewise a second of these, in the British Museum, which was placed with the two others first described, in one case, as a young bird; and it is most likely a male, as the ground colour is black, which, had it been a semale, would have partaken more of a brown colour.

38. ♣ LESSER BLACK O.

Le petit Troupiale noir, Buf. oif. iii. p. 221. Troupiale de la Caroline, Pl. enl. 606. f. 1. the female?

DESCRIPTION.

PETWEEN fix and seven inches long. Bill black: the whole plumage is likewise of a fine glossy black throughout, but about the head tinged with blue.

FEMALE.

The female has the head and neck not of fo deep a black as the rest of the body, tinged with blue on the wings and tail, which is even at the ends.

PLACE.

This is according to Buffon, who gives it as a non-descript species; observes that it is found in America, and soon grows tame.

That figured in the *Planches enluminées* as a female, has the head and neck cinereous brown. We have the name of a brown-beaded Oriole in the catalogue of North American animals, as a new species; and I have this very bird in my possession, but was led to suppose it a male, having seen at Capt. Davies's one of the same, with what was esteemed the semale, in the same case. This was wholly of a dusky ash-colour, palest beneath: chin and throat

white:

white: bill and legs exactly like the other. I am divided how to form my opinion here, as this last seems to be very like that described by Catesby * under the name of Cowpen.

The Rice bird of Guiana, mentioned by Bancroft +, feems like Buffon's male. He fays it has the bill of the Mocking-bird of Guiana: finall eyes, of a lively black, furrounded with circles of naked white skin: its head small: and all its feathers as black as jet. It frequents the fields of rice, whence its name.

Troupiale olive de Cayenne, Buf. oif. in. p. 225 .- Pl. enl. 606. f. 2.

CAYENNE OLIVE O.

DESCRIPTION.

PILL black: head, throat, fore part of the neck, and breaft, bright gloffy brown; deepest on the throat; inclining to orange on the breast, where it blends itself with the adjoining colour: the rest of the body olive, palest on the under parts: the quills are dusky or black, with a mixture of brown: legs black.

Inhabits Cayenne.

5 8

PLACE.

AOONALASH-KAN O.

DESCRIPTION.

ENGTH eight inches. Bill brown: plumage above brown; the middle of the feathers darkeft: between bill and eye a white mark: the wing coverts and fecond quills have the outer edges ferruginous: first quills brown: tail the same, but the outer edges ferruginous: chin dirty white: on each side, under the throat, a diverging mark of brown: fore part of the neck and breast ferruginous brown: middle of the belly plain: sides dusky: legs brown.

GOLDEN

SIZE of a Blackbird: length nine inches and a half. The bill is brownish red, and above an inch long: irides red: general colour of the plumage a fine golden yellow: between the bill and eye a streak of black: the wings black, marked here and there with yellow, and a patch of yellow in the middle of the wing: the two middle tail feathers black, inclining to olive at the base, and the very tips yellow; all the others black, from the base to the middle; from thence to the tip yellow: legs lead-colour: claws black.

The female is of a dull greenish brown in those parts where the male is black: wings dusky: tail dirty green, and all but the two middle feathers yellowish white.

This beautiful species is pretty common in several parts of Europe;

FEMALE.

Description,

Places and Manners

Europe; but I believe most so in France, where it spends the summers, and propagates its species. It is scarcely ever seen so far north as England or Sweden; yet mentioned as a bird of Russia, but suppose only the warmer parts of it; comes twice in a year into Switzerland, and sound also in Carniola; observed in Malta in September, on its passage southward, and returns in spring to the north through the same track; comes into Constantinople in spring, and leaves it in September, but stays in Alexandria till the beginning of November, when it takes its leave. From this, must suppose that it winters in Africa and Asia, especially as this very bird has been brought from China and Bengal, as well as the Cape of Good Hope.

The nest is of a curious construction, but perhaps not quite so as in some of the Orioles above-mentioned, though built after the same fashion. It is of the shape of a purse, fastened to the extreme divarications of the outmost twigs of tall trees, and composed of sibres of hemp or straw, mixed with fine dry stalks of grass, and lined within with moss and liverwort. The female lays four or sive eggs, of a dirty white, marked with small dark-brown spots, which are thickest about the largest end: she sits three weeks, and is observed to be very tender of her young, searing nothing for their desence; not unfrequently will suffer herself to be taken with the eggs and nest, and continue to sit upon them in a cage till she dies.

The food which this bird is most fond of is grapes and figs, in the season, also cherries, &c.; but at other times is contented with insects, and what else it can get.

It has a loud cry, which may be heard far off; but I do not hear it remarked by any one for the least fong, though Gesner says it whistles before rain. The sless is accounted good eating.

Willughby

Willughby faw these birds exposed in the poulterers shops in Na-ples for sale.

It is very likely that the yellow and buff fay * of Ray are only the male and female of the golden Thrush.

Oriolus melanocephalus, Lin. Syst. i. p. 160. N° 3. Le Loriot de Bengale, Bris. orn. ii. p. 329. N° 61. Le Loriot de la Chine, Bus. cist. iii. p. 262. II.—Pl. enl. 79. Black-headed Indian Icterus, Edw. 77.

VAR. A.

ENGTH eight inches and three quarters. The bill is inclining to red: irides hazel: the whole head, and the throat, of a full black: greater quills black, longitudinally marked with yellow: the baftard wing is also marked with yellow: tail the same, except the two middle feathers, which are black half way from the end, and the one on each side has a black spot on the inside web, in the middle: legs lead-colour: claws black.

STRIPED-HEADED O.

ATHER lefs than a Blackbird. Bill reddish yellow: head, throat, and fore part of the neck, black, tipped with white: hind part of the neck, back, rump, and upper tail coverts, reddish yellow: the under parts of the body the same, but paler: wing coverts and quills black, edged with white: tail reddish yellow: legs yellow: claws reddish.

DESCRIPTION.

Country unknown.

Le Talapiot, Buf. ois. vii. p. 82 .- Pl. enl. 605.

CLIMBING O.

ENGTH feven inches. The bill an inch and a quarter in length, strait, and pointed at the end: colour yellowish grey: the head, neck, and breast, are rusous, spotted and dashed with white: back, wings, and tail, rusous: the belly rusous brown: the tail is two inches long*, and rounded at the end; each feather has the shaft projecting in a point from the tip: legs blackish.

DESCRIPTION.

This inhabits Guiana, and is not unfrequent in the internal parts of that country. It climbs the trees like a Creeper or Woodpecker, to both which Buffon feems to think it inclined; but the straitness of the bill prevents its being ranked with the first, and the toes being situated three before and one behind, forbid it

PLACE.

^{*} In the Planches enluminées the tail appears to confift of ten feathers.

having place with the latter; neither do I hear that it has a tongue like that bird. It is found most frequently in company with the Climbing Grakle, and both appear to have the same manners, each supporting itself with the tail feathers, on occasion. Like the Woodpecker, feeds on the insects lurking beneath the bark of the trees, which it gets at by breaking up the bark with its bill. Both this and the Climbing Grakle are called Woodpeckers by the natives of Guiana.

Br. Muf. Lev. Muf.

CIZE of a Blackbird: length ten inches and a half. The bill is DESCRIPTIONS almost an inch and a half long, of an orange-colour, with the

tip yellow: the nostrils oblong, and placed in the middle of the bill: the irides are hazel: the feathers on the top of the head are short, like cut velvet, except just in the middle, to the hind head, where they are like those of other birds: on each side of the head is a naked membrane, beginning beneath each eye, and stretching to the hind head, but not uniting at that part; this is irregular in breadth, loose on the edges, and is of a yellowish colour, subject however to differ in colour at certain seasons of the year, or when the bird is angry or pleased, &c.: the general colour of the plumage is black, glossed with violet, purple, and green, in different reslections of light: on the quills is a bar of white *: the tail is composed of twelve feathers, is three inches in length, and even at the end: the legs are orange yellow: and the claws of a pale brown.

PLACE AND MANNERS.

This species is found in several parts of the East Indies, in the Isle of Hainan, and almost every isle beyond the Ganges; and is remarkable for whistling, singing, and talking well; much more so than any of the Parrot kind, and in particular very distinct. Its food is of the vegetable kind. Those kept in this climate are observed to be very fond of cherries and grapes: if cherries are offered to it, and it does not immediately get them, it cries and whines like a young child, till it has obtained its desires †. It is a very tame and familiar bird.

It is met with also in Java, where it is called Maynoa, and may be compared with the Lef-koa of the Chinese ‡.

^{*} This is not so in the Planches enluminées; but Buffon is not sure that it was not omitted by accident.

VAR. A. GREATER MINOR GR.

THIS exactly refembles the last in colour, but exceeds it much in fize, being equal to a fackdaw.

DESCRIPTIONS

This inhabits the Isle of Hainan, in Asia.

PLACE.

One described by *Bontius* is said to "resemble our country *Stare* in the sea-green and dark blue seathers, marked with cinereous spots; but it has a yellow crest on the neck, and its head is set with black soft seathers, that seeling of it you would think you touched velvet*." Whether that with the cinereous spots was a variety, or a distinct species, is not yet determined.

Le Goulin, Buf. ois. iii. p. 420.

Iting, Tabaduru, vel Gulin, (Palalacæ species) Ph. Trans. vol. xxiii. p. 1397. N° 43.

THIS equals a Blackbird in fize: and in length is ten inches. The bill is thirteen lines in length, of a brown colour: on the middle of the head, from the base of the bill to the hind head, is a narrow list of short brown feathers; the rest of the head and cheeks are bare of feathers, and slessh-coloured; but when the bird is irritated, becomes, like the last species, of a deep red: the general colour of the plumage on the upper parts of the

DESCRIPTION.

* See Willugh. p. 196. § 2.

body

body is filvery ash, but beneath grey brown: the wing coverts, quills, and tail, are black brown; the last three inches and a half in length: the legs and claws are brown.

In the Cabinet du Roi* are two of these; one the size above, with the under parts brown, spotted with white: the bare skin of the head, and the legs, as before: the other less, having the under parts of the body yellow brown, and the bare skin of the head, and end half of the bill, the legs, and claws, yellow.

PEACE AND MANNERS. Sonnerat brought one from the Philippine Isles, not unlike this it was about twelve inches in length: the bill blackish: the feathers surrounding the naked skin of the head, as well as between it, down the middle, black: the under parts of the body of the same colour: the wings, tail, and upper parts, grey, lightest on the rump and neck.

These birds are said to build their nests in hollows of trees, especially the cocoa-nut tree. They live on fruits; are very voracious, soon digesting what they eat; insomuch that a vulgar notion has arisen of their having no circumvolution of intestines, but only one strait passage from the mouth to the anus.

M. Camel, in the Philosophical Transactions above quoted, obferves that it is a noisy chattering bird.

PARADISE GR. Paradisea tristis, Lin. Syst. i. p. 167. N° 3. Le Merle des Philippines, Bris. orn. ii. p. 278. N° 35. pl. 26. f. 1. Le Martin, Bus. ois. iii. p. 423.—Pl. enl. 219.

DESCRIPTION.

HIS species is somewhat bigger than a Blackbird: lengthnine inches and a half. The bill is yellow, and an inche

* Hist. des ois. iii. 422.

and

and a quarter in length; in shape like the last species: the upper part of the head is covered with narrow black feathers, not ill refembling those of the Bird of Paradise in the same part: behind the eyes is a triangular bare space of a red colour: the throat, neck, and upper part of the breast, are blackish, tinged with grey: the lower part of the breast, the back, rump, scapulars, upper and under wing, and upper tail coverts, chestnut brown: thighs the same: belly, sides, and under tail coverts, whitish; as is the edge of the wing: prime quills half white half dusky; secondaries brown: tail deep brown; the side feathers tipped with white: legs yellow.

The female is like the male in plumage.

Inhabits the Philippine Islands.

It is a various feeder, scarce any thing coming amiss to it, and, like the last, very gluttonous in its appetite; is useful in its wild state, in freeing the backs of oxen from vermin; has been known, when kept in a cage, to swallow a young rat, more than two inches long, whole, only bruifing it against the wires to make it foft. Brisson mentions its being very fond of grasshoppers, and Buffon relates a curious anecdote on this head. The inhabitants of the Isle of Bourbon imported a pair of these birds, in order to free them from these insects, with which they were insested to a great degree: the attempt succeeded for a while; but the inhabitants, thinking they were otherwise hurtful, proscribed them by edict, on which the grasshoppers increased so fast, that they were obliged to fend for more; which, with their offspring, foon dispatched every grasshopper on the island. But these birds multiplying very fast, and wanting food, began on other things, such as fruits, grapes, dates, and all kinds of grain, and even entered dove-houses to destroy the young Pigeons; and are too numerous at this time to

FEMALE.

PLACE AND

MANNERS.

be eradicated, becoming a greater plague than that from which their first presence relieved them.

They build twice in a year, chiefly in the forked parts of the palm-trees, though not unfrequently in out-houses; and generally lay four eggs at a time. The young birds are easily tamed, and foon learn to speak, imitating the cries of the common domestic poultry, and other animals.

FETID GR.

Gracula fœtida, Lin. Syst. i. p. 164. No 3.

DESCRIPTION.

SIZE of a Magpie. The bill not unlike that of a Cuckow: the tongue plain, fleshy, and pointed: the nostrils oval and naked: the head is black, covered with upright, short feathers, like velvet: on the neck is a band, which is bare of feathers: the body is black: the outer edge of the quills of a blueish colour, but no white spot on any of them: the tail even at the end.

PLACE.

Inhabits America.

	,			
•				
•				,
			•	
		4		
			- 11	

parts; the edges of the quills and tail have a tinge of the fame: the wings reach to the middle of the tail, which is wedge-shaped, five inches and a half long: the legs and claws are black; the latter very stout and hooked.

There occurs in this bird a fingularity, which I have observed in no other, which is, the folding up of the tail feathers, totally different from birds in general; for, instead of being a plain surface at top, it sinks into a hollow like a deep gutter. A good idea may be formed by comparing it to an Hen's tail, with the under side uppermost. This bird always carries its tail expanded, when on the ground, folding it up in that singular manner above expressed, only when perched or slying.

I have received several specimens of this from Jamaica; and there are others in the Leverian Museum, all of which correspond with the account above given. The irides and notes are like those of a Jackdaw. It feeds on maize, beetles, and other insects.

Whether this be the bird meant by other ornithologists or not, I am scarcely clear about, as the singularity of the tail could not have escaped them; but I am certain that Linnieus did observe it, and it is most probable that he derived his trivial name * from that circumstance. This author says that it is fond of bananas.

This species is likewise common in North America, keeping company with the slocks of the purple Grakle, or next species, and red-winged Oriole. These breed in the swamps, and migrate in September, after which none are seen. This bird, and the Troupiale noir of Brisson, are consounded together by Linnaus; but a moment's inspection will prove them different, the bird above described being sour inches longer than Brisson's bird, which Busson

Br. Muf. Lev. Muf.

Description.

CIZE of a Blackbird: length eleven inches and three quarters. The bill is black, and fixteen lines long: irides white: the whole bird is black, but most beautifully and richly glossed with purple, especially on the head and neck: the irides are of a pearly grey: the tail is cuneiform: the legs and claws black.

FEMALE.

The female is wholly of a brown colour, deepest on the wings and tail.

PLACE AND MANNERS.

This inhabits Carolina, Mexico, and other parts of North America; also Jamaica.

These birds for the most part feed on maize, whence the name of Maize-thieves has been given them; but this is not their only food, for they are known also to feed on many other things. In spring, soon after the maize-seed is put into the ground, these birds fcratch it up again; and as foon as the leaf comes out, they take it up with their bills, root and all; but when it is ripe they still do more damage, for at that time they come in troops of thousands, and are so bold, that if disturbed in one part of a field they only go to another *.

In New Jersey and Pensylvania three pence per dozen was once given for the dead birds; and by means of this premium they were so nearly extirpated in 1750, as to be sew lest; but it was observed that the worms in the meadows encreased so, that they abated in the persecution of them, as it was observed that they sed on these worms till the maize was ripe †.

These build in trees, and are called by some the purple Daw. They now and then mix in company with the red-winged Maize-thieves ‡ and blue Jays, though for the most part are by themselves. They are said to pass the winter in swamps, which are quite overgrown with wood, from thence only appearing in mild weather; and after the maize is got in, are content to seed on other things, as the aquatic tare grass, and, if pushed by hunger, buck-wheat and oats, and even wheat, barley, and rye; they are said also to destroy that pernicious insect the bruchus piss.

We are told that their note is pretty and agreeable; but their flesh is not good to eat, as it is black and unsavoury.

^{*} Kalm. Trav. i. 291.

[†] In 1749 the worms left so little hay in New England, that it was forced tobe imported from other parts. Kalm.

Chinese Starling, or Blackbird, Edw. i. pl. 19.

Lew. Mus.

Description.

THIS is a little bigger than a Blackbird: length eight inches and a half. The bill is yellow or orange: irides fine orange: the general colour of the plumage blackish, with a tinge of blue: on the forehead, just over the bill, the feathers are longer than the rest, forming a kind of crest, which the bird can erect or depress at will: the greater quills are half way from the base white, the rest black blue: all the tail feathers, except the two middle ones, tipped with white: the legs are of a dull yellow.

These birds are said to talk and whistle very well, but not it that perfection as the *Minor*, or first species.

PLACE.

They are common in *China*, where they are much esteemed, and the figures of them are seen frequently in *Chinese* paintings. In *China* are kept often in cages. Their food is rice, insets, worms, and such like. But seldom brought to *England* alive, requiring the greatest care in the passage.

8. DIAL GR.

Saulary mas & fœmina, Raii Syn. p. 197. pl. 2. f. 19, 20. Little Indian Pie, Edw. 181. Bengal Magpie, or Dial-bird, Albin. iii. t. 17, 18.

SIZE of the Missel-thrush. The bill is black: irides yellow: the corners of the mouth tinged with the same: the head, neck and breast, back, rump, and upper tail coverts, are black: the belly, sides, thighs, and under tail coverts, white: the wing coverts next the body, and lesser quills, are also white; the outer wing coverts and quills are black: the tail is even at the end, black above, and white beneath: legs and claws brown.

DESCRIPTION.

The female differs in colour, being of a dark brown on the fore part of the neck and breaft, where the male is black; and the white parts not so clear, though the upper parts of the body are black, as in the male. FEMALE.

Edwards fays, that the two middle tail feathers are black, and the rest white.

Buffon makes this a Shrike, as does Briffon; but I really think that the first cannot mean the same bird with Edwards, if it be that figured in the Planches enluminees*, as we see there the bill of a Shrike very clearly; besides this, the tail is very much cuneiform, whereas that of Edwards is even at the end.

Inhabits Bengal.

PLACE.

^{*} Pl. enl. 477. f. 1. which is clearly the collared Shrike, p. 163.

egyptian Gr. Gracula atthis, Lin. Syst. i. p. 165. N° 8. Corvus Ægyptius, Hasselq. Itin. p. 240. N° 20.

DESCRIPTION.

SIZE of a Lark: length four inches. Bill dull black, with the base reddish: the eye is blueish: the head is statish at top: the plumage on the upper part of the body of a deep green, spotted with blue green on the crown, hind part of the neck, and shoulders: sides of the neck and back the same, but not spotted: on each side of the neck is a longitudinal broad line, the fore part of which is ferruginous, the rest of a whitish lucid blue: the throat is whitish: the belly ferruginous: the prime quills deep green on the outside, and blackish within; the tips the same: the tail is nearly even at the end, and of a deep blue: the legs blood red: claws blackish.

PLACE.

This inhabits *Egypt*, and is fupposed to live on insects, centipes, and scorpions; the remains of which were found in the stomach.

LONG-BILLED GR.

Gracula longirostra, Pallas Spic. vi. p. 6. t. 2. f. 2,

DESCRIPTION.

HIS is less than the Bee-eater: the length nearly nine inches. The bill is thirteen lines long, and a little bent: irides dusky: the nostrils placed in an hollow almost in the middle of the bill*, and covered with a black, smooth membrane: above the angles of the mouth are two black bristles, and a lesser ferruginous one behind them: tongue plain, deeply bisid at the end,

(as

^{*} Differing in this from other Graculæ, in which they are placed at the base.

(as are those of all the Grakle genus*) with lacerated edges: the head and neck are black: the back brown, inclining to ferruginous near the rump: beneath, from the throat to the vent, the plumage is of a dirty yellow: the sides under the wings undulated with black lines: on each side of the neck is a naked wrinkled band, passing lengthwise on the neck, and almost covered by the adjacent feathers: the wings are of a soot-colour, inclining more to brown towards the shoulders: all the prime quills, and part of the shafts, are white at the base, making, when the wing is closed, an oblique bar of white; but there is no white on the secondaries: the tail is cuneiform, black, tipped obliquely with white at the end, having most white on the outer feather, which is black for only one-third of its length from the base: its legs are long, robust, and black.

Inhabits South America and Surinam. We are indebted for the whole of this account to Pallas, who feems to have been the only one who has feen the bird; and which I place here on his authority.

PLACE.

30 2

body

body rufous, the under yellowish: both above and beneath marked with transverse dusky stripes: wings and tail plain rufous: the tail about four inches long, cuneiform, the outer feather one inch and a half shorter than the middle ones; all of them have the shafts projecting beyond the end of the feather about one-sixth of an inch, and sharp-pointed: the legs are one inch and a quarter inlength, and with the claws are dusky black.

PLACE.

This inhabits the interior parts of Guiana, where it climbs the trees in the manner of the Woodpecker; which circumstance occasions the inhabitants to blend it with those kind of birds without distinction. Buffon seems at a loss where to place this species, and thinks it holds place between the Woodpecker and Creeper genus, calling it Pic-Grimpereau. However the manners alone may incline one to this opinion, the shape and make of the whole bird do not favour the supposition: I have ventured therefore to rank it with the Grakles, as it appears to have many things in common with that tribe.

GENUS XVI. PARADISE BIRD.

- 8. Golden P. B.

RIRDS of this genus have

The bill flightly bending: the base covered with velvet-like feathers.

Nostrils small, and concealed by the feathers.

Tail confisting of ten feathers; the two middle ones*, in feveral of the species, are very long, and webbed only at the base and tips.

Legs and feet very large and strong: three toes forward, one backward; the middle connected to the outer one as far as the first joint.

The whole of this genus have, till lately, been very imperfectly known; few cabinets possessing more than one species, viz. the Greater, or what is called the Common Bird of Paradise: nor has any set of birds given rise to more sables than this, the various tales concerning which are to be found in every author; such as—their never touching the ground from their birth to death; living wholly on the dew; being produced without legs; and an hundred

^{*} Sometimes more: fee Forrest. Voy. p. 140, 141.

fuch stories, too ridiculous even to mention. This last error is scarcely at this moment wholly eradicated.

The circumstance which gave rise to this, did not indeed, at first, proceed from an intention to deceive, but merely from accident. In the parts of the world which produce these birds, the natives made use of them as Aigrets, and other ornaments of dress; and in course threw away the less brilliant parts. whole trouble they were at on this occasion, was merely to skin the bird, and, after pulling off the legs, coarfer parts of the wings, &c. thrust a stick down the throat into the body, letting an inch or two hang out of the mouth, beyond the bill: on the bird's drying, the skin collapsed about the stick, which became fixed, and supported the whole. They had then no more to do than to put this end of it into a focket fitted to receive it, or fasten it in some manner to the turban, &c. By degrees these were imported into the other isles for the same uses, and afterwards were coveted by the Japanese, Chinese, and Persians, in whose countries they are frequently feen, as well as in many parts of India; the Grandees of these last parts not only ornamenting themselves with these beautiful plumes, but adorning even their horses with the fame.

I believe the whole of this race to be natives of New Guinea, migrating into the neighbouring isles for a time, but returning to New Guinea in the breeding-season; and never at all found but within a few degrees of the equator.

The Dutch get them chiefly from Banda; and it is there that the story of their being without legs has been propagated, in order to enhance the value. The natives of Aroo bring them to that place by way of traffic, prepared as before mentioned, and put into the hollow of a bamboo for further preservation.

We

We are able here to enumerate eight species, the whole of which have come under our inspection; but are confident that there must be still others, both from the relations of authors, and the fragments we have met with, bearing no relation to those already mentioned; the describing of which would give not the least information to the reader.

Pigeon, but the body scarce exceeds that of a Thrush. The length, from the end of the bill to that of the tail, is twelve inches and a half: the bill greenish yellow, and an inch and a half long: the eyes very small: the head, which is likewise small in proportion to the bird, the throat, and neck, are covered with very short, dense, stiff seathers: those on the head and hind part of the neck are of a pale gold-colour: the base of the bill is surrounded with black feathers, appearing like velvet, changing in different lights to green: the fore part of the neck is green-gold: the lower part of the neck behind, the back, wings, and tail, are chestnut: breast deeper chestnut, verging to purple: from under the wings spring

GREATER
PARADISE
BIRD.

DESCRIPTION.

fpring a great quantity of feathers, with the webs so loose as to appear like a herring-bone, some of them near eighteen inches in length; these are of different colours, some chestnut and purplish, others yellowish, and a sew almost white: from the rump arise two seathers without webs, except for sour inches next the base, and the same at the tips; these appear to be the two middle tail feathers, and are the same colour as the rest of the tail, the seathers of which are six inches long, and even at the ends: the legs are stout, and of a brown colour.

FEMALE.

The female is said to be like the male, except that the long wire-like seathers of the tail have the webs shorter than those of the male. They are said to moult, and be without their long seathers for sour months in the year.

PLACE.

These birds are found in the Molucca islands, and those surrounding New Guinea, particularly in the isle of Arco: the Amboynans call them Manu-key-aroo; the natives of Ternate, Burongpapua, or Papua Birds; also Manuco-dewata, and Soffu or Sioffu. At Aroo they are called Fanaan. They are supposed to breed in New Guinea, coming from thence into Aroo at the westerly or dry monfoon; and are found there during the continuance of it; returning to New Guinea when the easterly or wet monsoon sets in. They are feen going and returning, in flights of thirty or forty, led by a king, which is constantly seen to fly higher than the rest: during this flight, they cry like Starlings. They are observed to take the advantage of flying against the wind, when it blows only moderate; but when in diffress, from the shifting of the wind, or blowing too strong, croak like Ravens. Sometimes, by the shifting o the winds, their long scapular feathers are dishevelled, which quite hinders their flight; in that case, are lost in the water, or fall on the ground; which if they do, they cannot rife again without gaining gaining an eminence: in this state, they are watched by the natives, who secure many, and kill them on the spot, as they cannot be kept alive by art; and the traffic in these birds is one part of their trade.—They are likewise taken with birdlime *, when they settle in trees, or shot with blunt arrows. They are sold at Banda, and its neighbourhood, for half a rixdollar apiece; but the people of Aroo are content with a spike-nail for each.

The true food of these birds is not certain, since the accounts given by authors differ widely: some say, that they feed on the red berries of the Waringa Tree +; others, that they are fond of eating Nutmegs ‡; some, that their food is large Buttersties §; and others aver, that they chase small Birds ||; which last circumstance is not improbable, as their legs and bills are sufficiently stout; and they are known to defend themselves courageously, whenever they are taken alive.

These birds were formerly brought into Europe without legs, and not a few were persuaded that they never had any; but the truth is, merely, that the legs are useless for the purposes designed by the natives, and are therefore torn off on the spot, and thrown aside. It is for ornament only, that these birds are coveted by such of the inhabitants of the East as are able to purchase them, the Chiefs of the country wearing them constantly in their turbans; and the Grandees of Persia, Surat, and the East Indies, use them as aigrettes, and even adorn their horses with them.

VAR. A. LESSER P. B.

Smaller Bird of Paradife, from Papua. Forr. Voy. p. 137.

DESCRIPTION.

HIS is every way, in make and shape, like the former, but is less in fize; the length, with the scapular feathers included, being not more than twenty-one inches. The bill is lead-coloured, with the point yellowish, one inch and a half in length: the eye surrounded with black: forehead and chin covered with velvety black feathers, reflecting a gloss of green: throat and fore part of the neck wholly green: the top of the head, nape, and half the neck behind, ferruginous yellow; lower half quite yellow: the back is likewise yellow, with a dirty greyish cast: breast, belly, wings, and tail, chestnut: from the upper part of the tail spring two wire-like shafts, as in the former bird, and a tust of herring-bone feathers from beneath each wing; these are either of a delicate white, or light yellow, the last chiefly on the sides, where many of the shorter ones have purple tips.

PLACE AND Manners. This bird is faid to be found only in the Papua islands, where it is called Shag, or Shague; by the people of Ternate, Toffu, or Boorong-papuwa. It is recorded, that the Papuans intoxicate them with Cocculus indicus, so as to catch them with the hand: they then draw out the bowels, sear the inside with a red-hot iron, and afterwards put each into the hollow of a Bamboo for preservation. I have reason to believe that they do more than simply exenterate them, as I have ever found that the skins only were preserved, and that in most, if not all, even the bones of the skull were taken away; whence the head, perhaps small by nature, appeared still less than it should be.

Thefe:

These build in tall trees, and are supposed not to migrate, like the first described; yet are said, like them, to sly in slocks, preceded by a king, who is black, with a purplish cast, and finer coloured than the rest.

The male is faid to have a longer neck and bill than the female. I esteem this a mere variety of the first, notwithstanding the affurances of authors about it, as above mentioned.

MALE.

Paradisea regia, Lin. Syst. i. p. 166. No z. Le petit Oiseau de Paradis, Bris. orn. ii. p. 136. No 2. pl. 13. f. 2. Le Manucode, Buf. ois. iii. p. 163. p. 13.-Pl. enl. 496. KING P. B.

THIS bird is about the fize of a Lark, and near five inches * in Description. length. The bill is one inch long, of a yellowish colour. and very little bent: the upper mandible covered half way with orange-coloured feathers: the eyes encircled with a black plumage: at the internal angle of the eye is a spot of black: the irides are yellow: the head, neck, back, tail, and wings, are of a bright red colour; the crown brightest; and the breast approaching to blood red; all having a rich fattin-like gloss: most part of the head is covered with foft short feathers, like velvet, but the other parts are like feathers in common: on the breast is a

* Forrest fays feven inches.

3 P 2

broad

broad bar of green, having the lustre of polished metal: the belly wholly white *: from each side, beneath the wings, spring several feathers of a greyish white, tipped with lucid green: the tail is not much more than an inch in length, and the wings, when closed, reach considerably beyond it: from the place of the middle tail feathers, spring two feathers which are webbed at the origin, the rest of the way quite naked, except at the extremities, where they are again webbed on one side, and coil in a spiral manner; the webs of a green-colour, and very glossy: the legs are about as stout as those of a Lark, and are yellowish brown.

PLACE AND MANNERS. It is found principally at Aroo, but only during the dry monfoon, coming from New Guinea, where it is supposed to breed. It is called at Aroo, Wowi, Wowi; in the Papua islands, Sopclo-o; being brought chiefly from Aroo Sopclo-o; and especially from Wadjir, a well-known village there.

The Dutch call it King Bird, and get it from Banda, to which place it is brought by the natives of the islands where it is found. It is faid not to affociate with any other of the Birds of Paradise, but slits solitary from bush to bush, wherever it sees red berries, without ever getting on tall trees.

This species is much more scarce, and in course much seldomer, met with in cabinets, than either of the former.

* In some specimens, there is a narrow bar of yellow above the green one, and the belly is green and white mixed.

· Magnificent Bird of Paradise?

L'Oiseau de Paradis surnommé le Magnisique, Son. Voy. p. 163. pl. 98.— Pl. enl. 631.

Le Magnifique de la Nouvelle Guinée, ou le Manucode à Bouquets, Buf. ois. ii. p. 166.

MAGNIFICENT P. B. PL. XIX.

CIZE of a Blackbird: length nine inches. The bill is an inch in length, a little bent, of a pale yellow, with the tip and base black: the feathers about the head are short and velvety: the crown and nape are of a deep chestnut yellow, but on the first incline to chestnut: the feathers which cover the nostrils, between the bill and eye, and round the chin, are short, thick fet, and stand out from the rest: between the gape of the mouth and the eye is a spot of lucid green: at the back part of the neck behind arises a tust of yellowish feathers, each of them marked near the tip with a fpot of black; beneath this first fprings a fecond packet, which is larger, and of a straw-colour, which lay loofely over the back: the back itself and tail are of a bright red brown: from the chin to the thighs the colour is blackish, having a reflection, in some lights, of green, and in a quiescent state of the bird, fall over part of the wing-coverts: down the middle of the throat, neck, and breast, the colour is blue green, and the feathers short and downy: the secondaries are of a deep yellow; the prime quills brown, and reach nearly to the end of the tail; from the place of the infertion of the middle ones arise two long wiry shafts, like as in the former species, which curve in a circle, and are furnished with very short green webs on one fide, and end in a point: the legs are yellow.

DESCRIPTION.

M. Sonnerat is the first who has described this bird; and informs us that it is found in New Guinea. In the collection of Miss

PLACE.

Blomefield is a fine specimen, from whence the above description was taken; and I have seen a second at Sir Joseph Banks's.

Aldrovandus talks of a crefted Bird of Paradise*, which he says had a crest near the neck, almost three inches high, ridged, of a yellow colour, and seemed to consist rather of bristles than seathers. But this bird was eighteen inches long: the bill long, black, and hooked; and the seathers of the head, neck, and wings, black, being yellow at the joining of the bill.

GORGET
P. B.
PL. XX.
DESCRIPTION.

HIS elegant species is about the fize of a Blackbird in the body; which, from the tip of the bill to the infertion of the tail, measures no more than about fix inches, the tail occupying all the rest. The bill is an inch in length, rather flout, moderately bent, and of a black colour: the forehead is furnished with tufted thick feathers, which occupy also the fides of the head; and beneath the eye, and round the throat, they are fo full as to enlarge those parts considerably in bulk: the colour of this part of the plumage is black, and like plush or velvet; but from the root of the under mandible, at the chin, are a few feathers of the common structure, with webs: the back part of the head, nape, and hind part and fides of the neck, to the beginning of the back, are of a gilded green, but the feathers are not much unlike those in common, and which, in course, sitting closer to the skin, give those parts a flat appearance: at the angles of the mouth begins a line of the most brilliant gilded copper-colour imaginable, which passes beneath the eye, growing wider by degrees, and finishes in a

^{*} Av. i. p. 811. pl. in 814.—Raii Syn. p. 21. No 4.—Will. orn. p. 92. No 4.—Compare also Forr. Voy. p. 140. No 6? kind

Gorget Bird of Paradise.

kind of crescent or gorget, of half an inch or more in width, on the fore part of the neck; beneath this, to the vent, the colour is dull green, except on the middle of the belly, where there is a transverse bright green band: the back is black, having both a copper and purple gloss, in different lights: wings deep black; beneath them the seathers are downy, but do not exceed at all in length, like in the other Bird of Paradise: the tail is of an enormous length, and consists of twelve feathers of unequal lengths, the two middle ones being near twenty-two inches long, and the outer one only five inches; the colour of all of them much the same as the back of the bird.

A complete specimen of this most singular species is in the posfession of Sir Joseph Banks, who collected it in the voyage roundthe world

This feems to bear some affinity with the black Bird of Paradise mentioned by Forrest*, which he says is four spans in length, and of a black colour, without any remarkable gloss; but as this is all he says, the matter cannot well be determined. He adds, that the Alfoories, or inhabitants of the mountains in Messowal, shoot these birds, and sell them to the people of Tidore.

L'Oiseau de Paradis à gorge violet, surnommé le Superbe, Son. Voy. p. 157. pl. 96.

Le Manucode noir de la Nouvelle Guinée, dit le Superbe, Buf. vis. iii. p. 169.—Pl. enl. 632.

SUPERBO

THIS is somewhat bigger than the King Paradise Bird †.

The bill is black; at the root of the upper mandible is a

DESCRIPTIONS.

* Forr. Voy. 1. 140. No 4. † The fig. in Pl. enl. measures ten inches.

black:

black creft, composed of fine, strait, and not very long feathers: the head, hind part of the neck, and back, are covered with green gold feathers; these are broad, and well furnished with webs, and have to the eye and touch every appearance of velvet, laying so over one another, that one may with propriety compare them to scales of a fish: the wings are of a dull deep black: the tail, on the contrary, has a blueish gloss: throat changeable violet, the feathers thereon like velvet: the belly bright green; on each side, from under the wings, is a tust of black velvety feathers of unequal lengths, which rise some height above the back, having the appearance of second wings, and turn downward towards the tail, many of these being as long as the wing itself: the legs are brown.

In the Leverian Museum is a bird somewhat like this, and nearly of the same size, but is wholly black on the head: from the place of the wings arise two tusts somewhat like those above described, but the wings themselves are wanting: on the upper part of the belly is the most brilliant set of black green glossy seathers imaginable, and in shape exactly forked like the tail of a Swallow; the seathers of which this is composed seem to be longer than the rest of the belly seathers, and stand out a little from the belly: the legs seem strong and black. As this is an impersect bird, I am unwilling to place it here as a species, especially as it is possible that from the wing tusts it may prove related to the last described.

L'Oiseau Paradis à gorge dorée, Son. Voy. p.-158. pl. 97. Le Sifilet, ou Manucode à six silets, Buf. ois. iii. p. 171.-Pl. enl. 633.

DESCRIPTION.

CIZE of the common Turtle. The bill is blackish: irides yellow: on the forehead, at the root of the bill, is a creft, which the bird carries nearly erect; this, when laid flat, extends not much beyond the eyes, and is composed of fine stiff feathers, not well furnished with webs; at first this crest is black, but some of the feathers are half black half white: top of the head, cheeks, and throat, are of a changeable violet black: fore part of the neck and breaft gilded changeable green, very brilliant: on the hind part of the neck is a large fpot of green gold: the back is deep black, with a violet glos: tail and wings black: beneath each wing arife long black feathers, which cover over and embrace the wings in a state of rest; the webs of these are loose like those of an Ostrich: on each side of the head, about the place of the ears, are three long feathers without webs, except a fmall part, of an oval shape, just at the tips; these are of such a length, that when ranged on each fide of the body, they reach a quarter way on the tail, which is fomewhat cuneiform: the legs are blackish.

from Holland, answered nearly to the above description, except in the long webless ear feathers; but though these were wanting in her bird, there remained, as it were, the rudiments of them, the bird having a few feathers longer than the rest at that part; nor had her's the Oftrich-like feathers under the wing. Buffon mentions

One of these birds, in the collection of Miss Blomefield, received

the like circumstance, in a bird published by M. Marvi, adding, that his bird had not the crest.—It is not improbable but the last-

3 Q

PLACE.

mentioned

mentioned birds may be mere fexual differences of that described by Sonnerat.

These birds inhabit New Guinea.

BLUE GREEN P. B. Le Calybé de la Nouvelle Guinée, Buf. oif. iii. p. 173.—Pl. enl. 634. L'Oiseau de Paradis verd, Son. Voy. p. 164. pl. 99.

Description.

ENGTH fixteen inches. The bill is flout and thick, and rather bent at the end; the colour black: the feathers of the head are of a velvety texture, and come very forward on the upper mandible; the plumage in general is of a fine blue, changing into green in different lights, or fea-green: the back, belly, rump, and tail, are feel blue, and very gloffy.

This feems to be the same with one in Sir Joseph Banks's collection. The bill in that bird was an inch and a quarter long: the tongue even at the end, and furnished with bristles: the tail cuneiform; the two middle feathers seven inches long; the outer ones three inches and three quarters: the whole plumage of the head and body seemed frosted, each feather being absolutely curled at the edges: the head and neck appeared to have the most reslection of green, and the body most inclined to purple: the wings were wholly wanting.

PERCE.

The bird above described came from New Guinea.

This can be no other bird than that of Sonnerat above quoted, which he fays is a trifle bigger and longer than the King Paradife Bird. The bill black: irides red: the bird is wholly of a fine green colour, which has the gloss of polished steel: the feathers of the head, neck, and body, are small, and ranged one over another.

like

like the scales of a fish, and appear in different lights to be blue and green alternate: the legs blackish.

> Oriolus aureus, Lin. Syst. i. p. 163. Nº 19. Le Troupiale des Indes, Bris. orn. app. p. 37. Nº 31. Le Rollier de Paradis, Buf. oif. iii. p. 149. Golden Bird of Paradise, Edw. pl. 112. Lev. Muf.

GOLDEN P. B.

T ENGTH eight inches. Bill an inch long, rather bent, and of DESCRIPTION. a brown colour, darkest at the tip: the throat, and fore part of the neck, for an inch and a quarter, are covered with black velvety feathers: the head, neck, and body, of a fine orange goldcolour; beneath yellow: the edge of the wings and the tail are black; the last has yellow shafts, and is fringed with yellow near the tip: the legs were wanting, as well as the quills, in Edwards's specimen, from which he figured his bird; but in the Leverian Museum there is a perfect one, in which I find the quills and tail to be black; in other things like that of Edwards. Supposed to inhabit the same places as the former ones.

5. Violet-headed C.

6. Spotted C.

7. Fasciated C.

THESE have a short, thick, and convex bill; and for the most part dentated on the edges.

Nostrils covered with stiff briftles.

Legs short, weak, and covered with feathers or down.

Toes placed two before, two behind.

Tail confifting of twelve feathers.

As far as I can learn, the manners of these birds are much alike, and for the most part agree with those of the first species there related. They are mostly inhabitants of South America, except the two last species, which inhabit Ceylon. They are said to differ much in the different stages of life, which has given rife to confufion of species, and may perhaps be the cause of the following account of them not being so perfect as may have been wished. They have been called Curucuis, or rather Couroucouis, at Guiana, from their note not ill refembling that word. Said to feed on fruits *.

RED-BELLIED CURUCUI.

SOMEWHAT less than a Magpie: length ten inches and a half. The bill pale yellow: irides golden: the under mandible furnished with stiff black bristles, and both the eye-lids with black ones: the head, neck, and upper part of the breast, the back, rump, and upper tail coverts, are of a shining green, with a gloss of blue in some lights: the throat is black: the wing coverts are blueish grey, marked with numerous zigzag lines of black: the quills are black, with part of the shafts white: the breast, belly, sides, and under tail coverts, of a sine red: the thighs blackish: the upper surface of the tail is green, much cuneisorm, and like the back, except the three outer feathers, which are blackish, and crossed with slender transverse lines of grey: the legs are brown. Brisson mentions a spot of white beneath the eyes, but this does not appear in the specimen in the Leverian Museum.

This species inhabits Mexico, Brasil, and Peru.

The female * is faid to differ, in having those parts, which are of a fine brilliant green in the male, black grey, and totally without gloss: the zigzag lines on the wings also are less conspicuous: and three of the outer tail feathers have the webs marked with black and white: the upper mandible is not yellow,

DESCRIPTION.

PLACE. FEMALE.

* Hift. des oif. vi. 288.

but

but brown, and the red colour does not extend fo high as the breaft.

VAR. A.

Avis anonyma tertia, Marc. Hist. Bras. p. 219.

Description.

MARCGRAVE also mentions another, which differs in having the wing coverts plain brown: the bill ash-coloured: irides saffron-colour, and wanting the bare spot beneath the eyes, which Brisson gives his bird in the description.

FEMALE.

This is probably a female likewife.

VAR. B.

Couroucou gris à longue queue de Cayenne, Baf. oif. vi. p. 283.—Pl. enl. 737.

Description.

BUFFON also mentions a further variety. The bill in this specimen was the same in shape and colour: almost the whole bird was of a cinereous grey, but on inspection some traces of green gold were very apparent, especially on the back and middle tail feathers: the lower part of the belly and vent only were red: and the tail itself very long; the three outside feathers of which had the outer webs and tips plain white; the three outer quills were also marked with black and white on the outer edges.

PLACE AND
MANNERS.

This came from Cayenne.

The nature of these birds is to lead a solitary life in the thickest forests, especially in pairing-time, when only two are sound together. At this time the male has a kind of melancholy

note,

note, (for at other times he is perfectly mute *,) by which the haunts are discovered. They begin to pair in April, and build in the hole of a rotten tree, laying three or four white eggs, about as big as those of a Pigeon, on the bare rotten dust; in defect of this rotten matter, they are faild to bruife even found wood into powder with their bill, which being fufficiently strong and toothed, may readily be supposed fully able to effect this. During the incubation of the female, the male takes care to provide food for her, and by his trivial fong, pleafant no doubt to her, to beguile the time, which, without fuch incitements, might feem too long. -The young, when first hatched, are quite bare of feathers; the head feems large, out of all proportion, and the legs, though short in the adult, seem too long. The parents feed these with fmall worms, caterpillars, and insects; and, when able to shift for themselves, forsake them, and return to their solitary haunts, till nature prompts them to produce their fecond brood, in August and September.

It has been tried to bring up these birds tame, but without effect, for they resuse to eat, and die in consequence. Monsieur Deshayes, to whom we are indebted for the above, observes, that they are called at St. Domingo, Le Caleçon rouge, and in other Mands, Demoiselle, or Dame angloise.

They never make any noise except while the female is sitting, for the moment the young are hatched, they again become silent.

YELLOW-BELLIED C. Trogon viridis, Lin. Syf. i. p. 167. N° 3. Le Couroucou verd de Cayenne, Brif. orn. iv. 168. No. 2. pl. 17. f. 1, Le Couroucou à ventre jaune, Buf. oif. vi. 291. Couroucou de Cayenne, Pl. enl. 195. Yellow-bellied green Cuckow, Edw. pl. 331.

DESCRIPTION.

ENGTH eleven inches and a half. Bill pale ash-colour, fcarcely an inch in length: the upper part of the head is violet, with a mixture of green-gold: the fides of the head and throat are black: the upper parts of the body green gold, passing forwards to form a band of the same colour on the breast: all beneath this is yellow-orange: the thighs are nearly black: the under wing coverts the fame, margined with white: the upper wing coverts and fcapulars black: quills black brown; the outer edges, from the base to the middle, white, from this to the end, frotted with white: the tail is cuneiform; the two middle feathers exceed the outer ones by near two inches, and are blackish, gloffed with green-gold; the fecond and third, on each fide, the fame, but the edges only are green-gold; the third has a black tip; the fourth is blackish also, indented with white on the outer edge at the tip; and the two outer ones, half way from the base, blackish, the rest white; and these two colours indented into each other, as in the former: the legs are feathered to the toes, with blackish feathers: the toes and claws are brown ash.

PDACE.

Inhabits Cayenne.

Trogon viridis, Lin. Syst. i. p. 167. No 3. s. Le Couroucou verd à ventre blanc de Cayenne, Bris. orn. iv. p. 170. No 3. Bus. ois. vi. p. 293*.

VAR. A. WHITE-BELLIED C.

THIS bird is a trifle smaller than the former, and differs only in having the belly white, instead of yellow: the end half of the tail feathers is white, separated obliquely, but indented with the other colour, as in the last.

DESCRIPTION.

Trogon strigilatus, Lin. Syst. i. p. 167. Nº 1. Le Couroucou cendré de Cayenne, Bris. orn. iv. p. 165. pl. 16. f. 1. Couroucou de la Guiane, Pl. enl. 765.—Bus. ois. vi. p. 293.

CINEREOUS

HIS is somewhat bigger than a Blackbird. Length twelve inches and a half. The bill is one inch long, and of a deep ash-colour: the general colour of the body is very deep ash; still deeper on the thighs and legs: the belly and under tail coverts of a fine orange yellow: scapulars, upper wing coverts, and the greater ones next the body, blackish, transversely striated with narrow whitish lines; those farthest from the body plain: under wing coverts deep ash, edged with white: greater quills blackish; the five first have white edges for two-thirds of the length; the secondaries blackish, marked with white on the outer edge, but white at the base: tail blackish; the six middle seathers six

DESCRIPTION.

3 R

inches

^{*} Buffon mentions one of these with a whitish belly, which had a strong citron tinge in many places; which would naturally lead one to think, that this was a mere variety of the yellow bellied one; see Hift, des oif, vi. p. 294.

inches and a quarter in length; the three outer ones shorten by degrees, the outmost ones being shorter than the middle ones by two inches; these are striated with white on the outer edge, and tipped with the same: the legs and claws deep ash-colour.

PLACE.

Inhabits Cayenne, Guiana, &c.

RUFOUS C. PL. XXI. Couroucou à queue rousse de Cayenne, Pl. enl. 736.—Buf: oif. vî. 293.

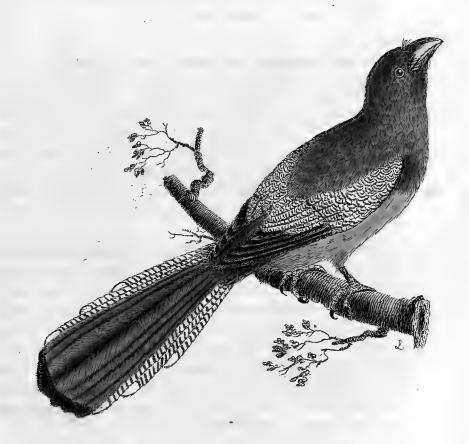

THE length of this bird is nine inches. The general colour rufous: the belly, thighs, and vent, yellow: the wing coverts are striated with black and grey, and the quills are black, with dusky edges: six of the middle tail feathers are of equal length, of a rufous colour, with black tips; the three outer ones transversely striated black and white, and tipped with white; shortening by degrees as in the others: the belly and legs dusky.

PLACE.
OBSERVATION.

Inhabits Cayenne.

Linnæus has mentioned the first and third of the four last mentioned, as distinct species; and the second, or that with a white belly, as a doubtful variety; but Buffon seems to think that the whole of the last mentioned are mere varieties, from age, sex, or other causes, and that they do not gain their green-gold plumage till mature age *: it is most likely, therefore, that the intermediate stages, in-which the colours appear so different, has been the cause of multiplying the species, and must continue to render the circumstance doubtful, till time, and more accurate observations, shall ascertain the fact.

• The difference in plumage between young and old birds, I can readily beneve; fince even the old ones, which I have seen, differ much from one another. In a collection which came from Cayenne, I observed a young bird, in full seather, which was wholly of a brown colour, with only here and there a trace of gold-green.

Rufous Curucui).

VIOLET-HEADED.

HIS measures nine inches and a half in length. The bill is lead-coloured at the base, and whitish at the point: on the forehead, round the eyes and the ears, it is blackish: the rest of the head, the throat, neck, and breast, very deep violet: the eyelids yellow: the back and rump of a deep gilded green: the upper tail coverts blueish green, and gilded as the others: the wings brown: the coverts and lesser quills dotted with white: the two middle tail feathers blueish green, tipped with black: the two next, on each side, partly of the last colour, and partly black: the three outer ones black, barred and tipped with white.

DESCRIPTION.

Spotted Curucui, Brown Illustr. t. 13.

6. SPOTTED C.

SIZE of a Nuthatch. Bill brown: crown deep green: neck, breaft, and belly, pale brown, barred with dufky: edges of wings white: coverts and fecondaries green, tipped with white: tail dufky, barred with white.

Description.

Inhabits Ceylon.

PLACE.

* M. Koelreuter, who mentions this in the Petersburgh Transact. above quoted, calls it a Shrike, and yet places, in his plate, the toes two and two. How he will reconcile this, I know not; the slightest observer must rank it with the Curucuis as the serrated bill, and short, feathered, and weak legs will testify.

Fasciated.

FASCIATED:

Fasciated Curucui, Ind. Zool. pl. 5.

DESCRIPTION.

ENGTH ten inches and a half: weight one ounce and fiveeighths. Bill black, thick, ftrong, and arched, befet with
briftles at the base: orbits naked, of a deep blue: irides yellow:
head and neck dusky black; palest on the breast: across the
breast is a band of white, beneath that the whole under side is
of a light, reddish, orange-colour: back tawny: tail coverts grey:
wing coverts, and scapulars, elegantly barred with undulated lines
of black and white: quills dusky, striped with white on the outer
webs: tail very long, unequal, the outer feathers the shortest;
tip black: legs dusky.

PLACE.

Inhabits Ceylon, where it is rare; called by the Cingalese, Rant-van-kondea. It is nearly like that in Bris. iv. 165; but the band of the breast, mentioned in the above specimen, shews it to differ from that of Brisson, which comes from Cayenne.

DESCRIPTION.

THIS is fix inches and a half in length. The bill is fifteen lines long; the upper mandible bent at the end, and, as it were, divided in two at the point; the colour black; it is half covered with briftles, which point forwards, and arife at the base: the head is large, in proportion to the rest of the body; the crown and fore part of the head incline to rusous: on the neck is a collar extending half round, composed of a mixture of black and rusous: on each side of the head, behind the eyes, is a pretty large black spot: the throat is orange, and the rest of the plumage beneath rusous white, spotted with black; that of the upper part of the body rusous brown: the legs are black. I have lately seen two specimens, in which the half collar at the back part of the neck had a mixture of white, and over the eyes an obscure whitish line; but in other things like the above.

PLACES AND MANNERS.

100

This bird is met with both at Cayenne and Brasil. The habit corresponds with that of the whole family. It is a clumsy, ill-made bird; and its manners exactly suit its shape, being a solitary, pensive, silent animal, affecting only such places as are farthest from habitations; being sound chiefly in the woods, where it chooses some low branch well covered with twigs and soliage; on this it perches, with its large head resting between its shoulders, for a long time together, and, as its disposition to action is very little, may be easily killed, as it will suffer itself to be shot at several times before it attempts to make its escape. The common

5

food

food is *Infetts*, particularly large *Beetles*; but the flesh does not prove good for eating. In the specimens above mentioned, which came under my inspection, the feathers of the tail appeared to have been worn by friction, as if one of the habits of these birds was to support themselves by the tails, like *Woodpeckers*.

It appears to me, that the Tamatia of Marcgrave is more likely to prove this bird, than the little Thrush of Catesby, which it is conjectured to be by Brisson*; the bristles at the base of the bill, therein mentioned, the large head, and flatness and broadness of the bill, seeming to fix it in this place, rather than with the Thrushes. As to the position of the toes in Willughby's plate, we must lay no hold of that, since errors of the like kind are frequent in old authors.

OBSERVATION.

Barbu de Cayenne, Bris. orn. iv. p. 95. No. 2. pl. 7. f. 1. Le Tamatia à tête & gorge rouges, Bus. vii. p. 96. Barbu de Cayenne, Pl. enl. 206. f. 1.

CAYENNE B.

SIZE of the crefted Lark: length feven inches. The bill above an inch in length, of a dark ash-colour, and a little bent towards the tip: the forehead and throat are red: top of the head black and grey, with a gilded gloss; each feather black in the middle: on each side of the head a band of white, passing over the eye, almost to the hind head: sides of the head black: the upper parts of the body black: edges of the feathers grey-gold: the fore part of the neck, breast, and belly, yellowish white: the sides dashed with cinereous olive, and

DESCRIPTION ..

Vol. ii. p. 212.—There is another Tamatia mentioned by Marcgrave, but this belongs to the Caucroma genus of Linnaus.

fome:

fome of the feathers marked with black near the tips: thighs olive: the leffer wing coverts black; the greater ones and fcapulars blackish, marked on the outside with a yellowish white spot: quills blackish, margined without with olive, and within with whitish: the tail cuneiform; olive-brown above, and cinereous beneath: legs and claws cinereous.

PLACE.

Inhabits Cayenne.

VAR. A. BLACK-SPOTTED
B. Le Barbu tacheté de Cayenne, Bris. orn. iv. p. 97. N° 3. t. 7. f. 4.

Barbu de St. Domingue, Pl. enl. 746. fig. 2.

Yellow Woodpecker with black spots, Edw. pl. 333.

Br. Mus. Lew. Mus.

DESCRIPTION.

SIZE of the last: length six inches and three quarters. Bill as in the last: forehead and throat red: top of the head black, with the edges of the seathers grey-gold: sides of the head, and hind part of the neck, black; the edges of the seathers whitish; those of the rump also black, with grey edges: the under parts of the body pale yellow: the breast and sides marked with large black spots: thighs olive: wing coverts, quills, and tail, as in the last, except that the two sirst are not spotted with white; but the legs are similar.

PLACES.

This likewise inhabits Cayenne.—Both of these last are also met with at Guiana and St. Domingo; and, no doubt, in other hot parts of America. They are mere varieties of each other, the size being the same; differing only, in that the first has a spot of white over the eyes, and several of the same on the wings; both of which are wanting in the last described. This last is also spotted on the breast considerably, whereas in the first there are only a few spots on the sides.

COLLARED

GIZE of the Red-backed Shrike: length feven inches and a quarter. The bill is nearly an inch and a half in length, horn-coloured, and bent at the tip; the gape reaching beneath the eyes: the upper part of the head, the nape, and hind part of the neck, are rufous, striated with fine lines of black: the sides of the head plain rufous: at the lower part of the neck, between that and the back, is a narrow fulvous band, which extends forwards towards the neck, on each fide; this is accompanied by a narrower one of black, which unites to a broader one on the breast; beyond this, the back, wings, and rump, are rusous, firiated with black: the throat and fore part of the neck are dirty white: on the breaft is a broad band of black; from thence to the vent rufous white: the tail is rufous, two inches and a quarter in length, and croffed with narrow bars of black; the fix middle feathers are equal in length; the three others on each fide shorter by degrees to the outer one, which is the shortest of all: the legs and claws are ash-coloured.

This is found at Guiana, where it is not common.

There can be no doubt of this being the bird meant by Linneus, since he refers to the one in Brisson above quoted; yet he makes his bird an inhabitant of Africa. He likewise adds, that it had only ten tail feathers. The reader must reconcile this to himself; for I cannot account for the disagreement, especially as the bird above described is of American origin.

Description.

PLACE.

BEAUTIFUL B.

Le Barbu des Maynas, Bris. ern. iv. p. 102. No 5. pl. 7. f. 3.—Pl. enl.
330.

Le beau Tamatia, Bus. ois. vii. p. 98.

DESCRIPTION.

HIS is a very beautiful species, being of a less clumsy make than most of the others, and more lively in disposition. It is of the size of a Sparrow: length five inches and three quarters. Bill ten lines long, and of an ash-colour, with the edges and tip of a yellowish white: top of the head, sides, and throat, red, edged round with light blue: at the corners of the mouth begins a streak of the last, dividing the red on each side: the upper parts of the body and tail are green; the last cuneiform, and composed of ten feathers: the quills are brown, with the outer edges green: the fore part of the neck and breast deep yellow: on the lower part of the breast is a pretty large red spot; the rest of the parts beneath yellowish white, spotted longitudinally with green: the legs and claws are ash-colour.

PLACE.

Inhabits the country of Maynas, on the borders of the river Amazons, in South America; and perhaps in other parts of that continent also.

GREATER PIED B.

DESCRIPTION.

Tamatia noir & blanc, Buf. ois. vii. 99. Le plus grand Barbu à gros bec de Cayenne, Pl. enl. 689.

THIS is about feven inches in length, and is somewhat remarkable for the fize of the bill, which exceeds that of the other species both in length and thickness; it is pretty hooked; and, as it were, divided into two parts at the tip, like the first species;

the colour black: the forehead is white: the crown of the head and nape black: on the fore part, this colour is prolonged downwards, and half furrounds the eye: the forehead, fides under the eye, throat, and fore part of the neck, are white, extending in a narrow collar round the nape behind: the lower part of the neck, back, and wing coverts, are black, margined with dufky white: across the breast a band of black: the quills and tail are likewise black; but the feathers of the last have white tips: the belly and vent are white: the sides and thighs black and white mixed: and the legs dusky.

Inhabits Cayenne.

PLACE.

Tamatia noir & blanc, Buf. ois. vii. p. 99. Le plus petit Barbu à poitrine noire de Cayenne, Pl. enl. 688. 6. LESSER PIED

THIS bird is much less than the last, and measures only five inches in length. The bill is pretty large in proportion, and bissid at the tip, as the last species: the colours of the plumage are only two, viz. black and white, like the last, but are differently disposed: the upper parts are black, but there is a little mixture of white on the forehead, and a spot of white on the scapulars: behind the eye is a streak of white: the throat and sides of the neck are white: on the breast a broad band of black, which extends upwards a little way into the white on the sides of the neck, like a crescent: from this to the tail the under parts are white, except on the sides under the wings, where there is a mixture of black: the tail is black, tipped with white: the legs dusky.

Description.

This likewise inhabits Cayenne.

PLACE.

500

In one specimen which I have seen, instead of a mixture on the forehead, there is only a small spot of white: the white streak, which springs behind the eye, is extended downwards on each side the neck: and some of the outer tail feathers are white at the base, otherwise like the above description.

Were it not for the very great disproportion in their size, one would conclude them to be varieties of each other, they are so alike.

YELLOW-THROATED Le Barbu des Philippines, Bris. orn. iv. p. 99. N° 4. pl. 7. f. 2. the male.

—Pl. enl. 331.

Le Barbu à gorge jaune, Buf. oif. vii. p. 102. pl. 5.

Description.

0 5.

SIZE of an House-sparrow: length five inches and a half. The bill brown, pretty thick, and near an inch in length: the top of the head, as far as the crown, is red; the rest of the head, and upper parts of the body, wings, and tail, dull green: on each side of the head is a large spot of yellow, in the middle of which the eye is placed: the throat and fore part of the neck are yellow: on the upper part of the breast is a transverse broad band of red: the rest of the under parts dirty yellow, longitudinally streaked with dull green: the legs are yellowish: claws brown.

FEMALE.

The female has no red on the head nor breast; and the spot in which the eyes are placed, the breast, and fore part of the neck, are yellowish white; otherwise like the male.

PLACE.

Inhabits the Philippine Islands.

Le Barbu de l'Isle de Luçon, Son. Voy. p. 68. t. 34. Le Barbu à gorge noire, Buf. oif. vii. p. 103. Br. Muf. 8. BLACK-THROATED B.

THIS is a little bigger, and somewhat longer in shape, than the common Grosbeak. The bill is blackish: the forehead of a fine red: the top, hind part of the head, throat, and neck, are black: above each eye is a curved stripe of yellow, which, as it proceeds downwards, becomes white, and descends in a strait line to the lower part of the neck on each fide; under this is a black stripe; and between this and the throat is a band of white, which goes on to, and blends itself with the breast; which, as well as the belly, fides, thighs, and under tail coverts, is white: the middle of the back is black; but the fide feathers between the neck and back have a yellow fpot on each: wing coverts black; four of them are fringed with white, and one with yellow, forming a stripe across the wing: beneath this some of the feathers are spotted with yellow at the ends; and still below these there are other feathers which have yellow margins: the quills are black, bordered with yellow: the four middle tail feathers black; the others black, fringed with yellow: the legs are black.

Description.

Inhabits the Philippine Isles.

A specimen of this is now in the British Museum, said to have been brought from the Cape of Good Hope. The length of this bird is seven inches: the colour of the plumage the same; added, that the rump is of a beautiful yellow.

PLACE.

8. Var. A. Le Barbu à plastron noir, Buf. eif. vii. p. 104. Barbu du Cap de Bonne Esperance, Pl. enl. 688. f. 1.

DESCRIPTION.

HE length of this species is six inches and a half. The bill is black: the forehead is crimson: from this passes a stripe of black over the head, and down the back part of the neck to the back: the sides of the head and neck are white, and passes forward to the breast; from which to the vent the under parts are white: the white on the sides of the head is diversified, first, by a streak of yellow, which is placed over the eyes; and secondly, by an irregular streak of black, beginning at the base of the upper mandible, and, dividing the white into two parts, ends on the shoulders: the chin and fore part of the neck are also black: the upper parts of the body and wings are mixed brown and yellow, the edges of the feathers being for the most part fringed with this last colour; but the rump is almost wholly of a pale but bright yellow: the tail is brown, with yellow margins: the legs are lead-colour.

PLACE.

This was received from the Cape of Good Hope. Its manners are totally unknown.

This is either a young bird of the last species, or differing in fex. The head, neck, and breast correspond; but the body seems more variegated; the markings not so distinct as in the other, which is the case often in young birds.

Le petit Barbu, Buf. oif. vii. p. 105. Barbu du Senegal, Pl. enl. 746. 2.

LITTLE B.

DESCRIPTION.

THIS is perhaps the smallest of its race, measuring only four inches in length. The bill is brown: the upper parts of the body blackish brown with a sulvous tinge; and on the quills and tail a cast of green: the seathers of the first are white on the edges: the under parts of the body are white, dashed perpendicularly with brown; but the throat is yellow: and there is a short streak of white at the angles of the mouth, beneath the eye: the legs are pale red or sless-colour.

This came from Senegal.

PLACE

Le grand Barbu, Buf. oif. vii. p. 106. Grand Barbu de la Chine, Pl. enl. 871.

GRAND

DESCRIPTION.

THIS species is eleven inches long. The bill is an inch and ten lines long, and an inch thick at the base, where it is beset with black bristles, and the colour of it whitish, with a black tip: the plumage for the most part is of a fine green, but differs in various parts of the body; for the head and fore part of the neck incline to blue in different lights, while the hind part of the neck, and part of the back, have a cast of chestnut brown: the greater quills have a mixture of black: and the under tail coverts are of a fine red: the legs are dusky yellow.

Inhabits China.

PEACE.

GREEN B. Le Barbu vert, Buf. oif. vii. p. 107. Barbu de Mahé, Pl. enl. 870.

Description.

whitish, an inch and two lines long, and seven lines thick at the base, where the upper mandible is surnished with black bristles: the head and neck are greyish-brown; the feathers of the last edged with whitish: above the eye is a white spot, and another of the same beneath it: the rest of the bird is of a very sine green, palest on the under parts, except the greater quills, which are brown: the legs are dusky.

PLACE.

This species inhabits *India*. The above specimen came from *Maké*.

BUFF-FACED
B.
PL. XXII.

DESCRIPTION.

Br. Muf.

ENGTH fix inches. Bill pale, beset with bristles at the base, which are somewhat longer than the bill itself: the forehead, chin, and sides of the head, round the eyes, are of a dull buff-colour: upper parts of the head and body are dark olive-green; the under parts lighter: the wings are the same as the upper parts, but the quills are dusky, with greenish edges: the tail is likewise dusky and short: legs and claws yellow.

A specimen of this is in the British Museum, but its native place uncertain.

Buff faced Barbet.

`

SIZE of a Lark: length feven inches. The bill is one inch in length, curved at the point, and compressed on the sides; the colour brownish black; but the base is yellow, passing obliquely forward from the nostrils to near the end of the lower mandible: the nostrils are covered with bristles pointing forwards, about one-third of the length of the bill: the head is large, and very sull of feathers: the plumage is brown throughout, with a dash of a pale cream-colour down the shaft of each feather: on the breast is a large triangular whitish spot: the quills and tail are plain brown, the last cuneiform: the legs brown: toes placed two and two, asin others of the genus.

Supposed to inhabit Cayenne, as it was in a parcel of birds which came from that place.

WHITE-BREASTED B.

DESCRIPTION.

PLACE.

Red-crowned Barbet, Brown's Illustr. p. 30. pl. 14.

SIZE of a Goldfinch: length five inches and a half. Bill dusky: crown and throat scarlet: above each eye a black line on the cheeks; and above each shoulder a great whitish spot: back and wing coverts fine green: prime quills dusky: breast yellow; in the middle a short transverse bar of black, and another of red: belly white: tail green; the exterior feathers dusky: legs pale red.

Inhabits Ceylon.

RED-CROWNED B. Description.

PLACE.

YELLOW-CHEEKED B.

Yellow-cheeked Barbot, Brown's Illustr. p. 34. pl. 15.

DESCRIPTION.

SIZE of the last. Bill red: head and neck pale brown, clouded: fides of the head, round the eyes, naked and yellow: back pale green: wing coverts the same; the middle of each feather spotted with white: primaries green; interior edges dusky: belly pea-green: tail green: legs pale yellow.

PLACE.

This was also sent from Ceylon, with the last, by Governor Loten.

DOUBTFUL B.

Le Barbican, Buf. oif. vii. p. 132. Le Barbican, des Côtes de Barbarie, Pl. enl. 602.

Description.

HIS bird is nine inches in length. The bill is eighteen lines long, and ten in thickness at the base, where many long black bristles take their origin, reaching beyond the nostrils: the upper mandible is bent, and has two notches at some distance from the tip; and the under mandible is transversely channeled beneath: the colour of the bill is reddish: the upper parts of the body, wings, and tail, are black; the last is three inches and a half long: the under parts of the body are red, except a band on the upper part of the breast, which is black: the thighs and vent are also of this last colour: the legs are very short, and of a reddish-brown-colour: toes placed two before and two behind.

PLACE AND OBSERVATIONS.

This bird inhabits the Coasts of Barbary, and is of a doubtful genus. Buffon places it between the Barbets and Toucans, to both of which it seems to belong; however, it seems most to incline to

the

the former: First, from its place of nativity, as no true Toucan is found throughout the old Continent: Secondly, the tongue is slessly, and not pennaceous, which last is one of the characteristics of the Toucan genus: And thirdly, the bristles which project from the base of the bill, added to the others, incline me to give it place in this chapter.

WAX-BILLED B.

Description .

SIZE of a Blackbird: length eleven inches and a half. Bill one inch and a half long; rather compressed on the sides, and curved the whole length, but most so near the tip; the colour that of vermilion, or fine red sealing-wax: the nostrils are covered with restected bristles; and besides these a sew others, which reach more forward on the bill: the head, neck, and upper parts of the body, dusky black: lesser wing coverts, nearest the body, mixed with white: breast and belly cinereous: quills and tail of a full black; the last rounded in shape: legs dusky: toes placed two and two as in other Barbets.

Some specimens are of a fuller black than others, and the ash-colour on the under parts deeper.

Supposed to inhabit Cayenne. I have lately seen several of the above which came from that place, and much suspect them to be the same with the red-billed Crow, p. 403, as I remember that at the time of my describing the last, I had not a view of the legs sufficient to identify the genus.

others IO .

DESCRIPTION.

CUCKOW.

510

others marked with white spots on each side their shafts: the legs are short, and yellow.

FEMALE.

The female differs somewhat: the neck, both before and behind, is of a brownish red: the tail barred with this last colour, and black; and spotted on each side the shaft with white.

Young.

The young birds are brown, mixed with ferruginous and black; and in that state have been described, by some authors, as old ones.

To this account, taken from the British Zoology, I cannot add any thing material.

MANNERS.

It is on all hands allowed, that the *Cuckow* does not hatch its own eggs: the reason of this does not appear manifest; possibly it may be occasioned by the great size and length of the *stomach*, which protrudes far beyond the *sternum*, that part being so very short, as not to be sufficient to take off the pressure in incubation, whereby digestion may be impeded.—This circumstance has not failed to strike me on diffection.

This bird is supposed most frequently to lay only one, or at most not more than two eggs; it is generally believed only one, but the possibility of laying two must appear manifest, from two eggs having been found, nearly ready for laying, in the ovary of a semale of one of these; and an instance has not been wanting, where two eggs have been laid in one nest*. The egg is bigger than that of a Nightingale, and longer in proportion: of a greyish white, marked with some spots of dull, and others of a darker violet brown. A Water-wagtail, Yellow-hammer, or Hedge-sparrow, is generally the nurse of the young Cuckow; but Busson enumerates twenty sorts of nests, at least *, in which they have deposited their eggs. It may be supposed, that the semale Cuckow lays

^{*} Hist. des ois. vi. p. 324. † Br. Zool. vol. i. p. 234.

her eggs in the absence of the bird, in whose nest she intends to deposit; as it has been known, that on sight of one of these, a Redbreast, and its mate, jointly attacked it, on its approaching the nest, putting her to slight; and so essectually drove her away, as not to dare to return †. Several experiments have been made, to ascertain whether the Cuckow destroys, or eats, the eggs which she finds in the nest in which she deposits her own; the result proved the contrary; for a Cuckow's egg has been often sound along with others, which truly belonged to the nest; on all of which the bird has sat; and, in this case, if the number of eggs proves too much for this little nurse to brood conveniently, she frequently destroys one after another; and not only her own, but sometimes even the parasite egg also, if the whim takes her; and, on the contrary, the bird often proves a mother and step-mother at the same time ‡, by bringing into life the whole brood.

It is supposed, that there are more male Cuckows than females; since two are often seen in dispute, where a third has been in fight; which, no doubt, was of the opposite sex. Mr. Pennant observed, that five male birds were caught in a trap in one season; and I can say myself, that out of at least half a dozen, that I have attended to, my chance has never directed me to a female . As to the external marks, they have been noticed above; and it is to be wished, that future observers may determine, whether our observations have rise only in chance, or are sounded on the general circumstance. The young birds are observed to be helpless and soolish, for a great length of time, but may be, and often are, brought up

^{*}Hist. des ois. vol. vi. p. 332. † Id. p. 329. ‡ Hist. des ois. vi. pp. 325. 309.

Il believe that the male birds are more liable to be shot, their note directing the gunner where to take aim; while the female is secured by her silence.

Food.

tame, fo as to become familiar. They will eat in this state bread and milk, fruits, infects, eggs, and flesh, either cooked or raw; but in a state of nature, I believe, chiefly live on caterpillars; which, in the few I have observed, were all of the smooth kind; others have found vegetable matter, beetles, and small stones *. When fat, faid to be as good-eating as a Land Rail.

Their coming into England, where they are only migratory, is about the middle of April; at least we hear, about that time, their first call to love, which is only used by the male. About the end of June this ceases, though the Cuckow does not take its final leave till the end of September, or the beginning of October; but perhaps fome few may stay with us, or how shall we account for their being heard to call in February +. I have heard this bird at midnight two feveral times.

MIGRATION.

The major part are supposed to go into Africa, since they are observed to visit the Island of Malta twice in a year, in their pasfage backwards and forwards, as is supposed, to that part of the world; they are well known also at Aleppo t. To the North, it is faid to be common in Sweden; but not to appear so early, by a month, as with us. Russia is not destitute of this bird. And we have feen a specimen brought from Kamtschatka, now in the possession of Sir Joseph Banks.

VAR. A. RUFOUS

DESCRIPTION.

Le Coucou roux, Brif. orn. iv. p. 110. No 1. A.

HIS is a mere variety of a young bird, having the upper parts varied with rufous, where the other is white.

Coucou

^{*} In some manuscript notes, which I saw at Sir A. Lever's, in the handwriting of the late Dr. Derham, he mentions finding hairy caterpillars, and eggshells, in the stomach of a Cuckow.

^{*} Rufell Alep. p. 71.

Coucou du Cap de Bonne Esperance, Buf. ois. vi. p. 353.-Pl. eni. 390.

CAPE C.

A TRIFLE smaller than our Cuckow: length under twelve inches. Bill deep brown: irides yellow: the upper part of the body greenish brown: throat, cheeks, fore part of the neck, and upper wing coverts, of a deep rusous colour: tail feathers rusous, but paler, tipped with white: the breast, and all the under parts of the body, white, crossed with lines of black: legs reddish brown.

Description.

Inhabits the Cape of Good Hope, and is most likely the same bird which is called Edolio, from its pronouncing that word frequently in a low melancholy tone. PLACE AND MANNERS.

Voyagers also mention another Cuckow, which is common to Loango, in Africa. This is bigger than ours, but of the same colour, and repeats the word Cuckow like that bird, but in different inflexion of voice. It is said that the male and female together go through the whole eight notes of the Gamut; the male, beginning by itself, sounds the three first, after which he is accompanied by the female through the rest of the octave *.

dible

dible springs a band of black, which passes through the eyes almost to the hind head, and is broad in the middle: scapulars, upper wing and tail coverts, deep brown, marked with small white and pale cinereous spots: quills brown; each of the secondaries marked with a pale cinereous spot: tail cuneated, blackish; all but the two middle feathers tipped with white: legs and claws black.

PEACE.

Inhabits Andalusia. The specimen from which this description was taken, was shot on the Rock of Gibraltar.

♣ SOCIETY
C.

Le Coucou brun varié de noir, Buf. ois. vi. p. 376. Ara Wereroa, Gooke's Voy. vol. iv. p. 272. Lev. Mus.

DESCRIPTION.

Bill an inch and a quarter long, stout, and somewhat curved at the point: the upper mandible blackish; the under one pale; irides pale yellow: the upper parts of the body are brown: the head dashed with perpendicular ferruginous stripes: the rest of the plumage above transversely barred and blotched with the same: the middle of each seather of the neck darkest: over the eye is a white streak, and a dash of the same along the under jaw, arising at the nostrils: the quills marked with ferruginous spots: the chin and middle of the throat white: sides of the neck, the breast, belly, and thighs, white, streaked perpendicularly with brown; the streaks broadest on the breast and belly: the vent plain white: under tail coverts pale buff; the upper ones as the back, reaching to one-third of the tail, which is nine inches long, and much cuneated; all the feathers are crossed with nu-

merous.

merous ferruginous brown bars, and tipped with white: the wings, when closed, reach nearly to one-third of it: the legs are greenish.

This species inhabits Otabeite, where it is called Areva-reva. It is also found in some of the neighbouring isles, where it is called Tayarabbo.

PLACE.

Cuculus Mindanensis, Lin. Syst. i. p. 169. N° 3.

varié de Mindanao, Bus. ois. vi. p. 373.—Pl. enl. 277.

MINDANAO C.

MUCH bigger than our Cuckow: length fourteen inches and a half. The bill is of a grey brown: the general colour of the plumage gilded brown, marked with white spots, as also with pale and darker rusous ones: the under parts are white, transversely streaked with blackish; but the fore parts of the neck and throat are plain brown, spotted with white: quills brown, spotted with rusous on the outer, and with white on the inner webs: tail of a gilded brown, crossed with transverse rusous bands on each side the shaft, and some of the tail feathers tipped with white: legs and claws grey.

DESCRIPTION.

This is found at Mindanao, and other of the Philippine Islands. At first sight it has the appearance of a young European Cuckow, but on comparison it will be found far different from that bird, especially in the quills and tail.

SPOTTED
C.

Cuculus Scolopaceus, Lin. Syft. i. p. 170. N° 11. Le Coucou tacheté de Bengale, Bris. crn. iv. p. 132. N° 13. Le Boutsallick, Bus. cis. vi. p. 372. Brown and spotted Indian Cuckow, Edw. pl. 59.

DESCRIPTION.

IN bulk this is no bigger than a Thrush, but measures sourteen inches in length. The bill is of a dirty yellow green, and above an inch long: the plumage on the upper parts of the body is rusous, the seathers edged with brown; on the under parts white, edged with brown: the lower part of the belly, and under tail coverts, have a mixture of rusous: the wing coverts are white, edged with brown: quills and scapulars transversely striated with brown and rusous: tail cuneiform, seven inches and a half in length; the colour of it inclined to rusous, crossed with oblique broad bands of brown: legs dirty greenish yellow.

PLACE.

Inhabits Bengal, where it goes by the name of Boutfallick.

CHINESE SPOTTED

· Le Coucou tacheté de la Chine, Buf. oif. vi. p. 378.-Pl. enl. 764.

DESCRIPTION.

ENGTH fourteen inches. Bill almost an inch and a half long, blackish above, and yellow beneath: the upper part of the head and neck are blackish, spotted with white about the eyes: all the upper parts of the body of a deep greenish grey, marked with white, and glossed with gilded brown: throat and breast regularly variegated with brown and white: the rest of the under parts barred with the same: the tail is six inches and a half long, even at the end, and barred with the same colours: the legs are yellowish.

PLACE.

Inhabits China.

brun piqueté de roux, Bust. ois. vi. p. 377.

tacheté des Indes Orientales, Pl. enl. 771.

RUFOUS SPOTTED C.

ARGER than our Cuckow: length fixteen inches and a half. Bill horn-colour; from the base of it to the ears, passing under the eyes, is a rusous band: the plumage on the upper part of the body is brown, spotted with rusous; beneath rusous, transversely marked with blackish brown striæ; those on the belly least numerous: the tail is cuneated, eight inches and a quarter long, transversely barred with rusous arched bands on each side the shafts; all the feathers have rusous ends: the legs are grey brown: the claws blackish.

Description;

The female differs in having the rufous spots on the upper parts less numerous, and the under parts much paler, than in the male.

FEMALE.

This species is found in the East Indies, and in the Philippine Islands.

PLACE.

Le Coucon tacheté de l'Isle de Panay, Son. Voy. p. 120. pl. 78.

PANAYAN SPOTTED C.

THIS is two-thirds bigger than our Cuckow. The bill is black: irides yellow: the upper parts of the body a very deep brown, fpotted with rufous yellow; these spots are oblong on the head, and round on the neck, back, and wing coverts; but on the quills they are transverse, and yellowish, intermixed with black dots: the throat is black, spotted as the back:

Description.

518

breast and belly pale rusous, transversely striped with black: the tail is long, even at the end, of a rusous yellow, crossed with transverse bars of black: the legs are lead-colour.

PLACE.

Inhabits the *Isle of Panay*. It must be observed, that it differs from the last in two particulars, viz. in wanting the rusous mark under the eyes, and the tail not being cuneated as in the last bird; otherwise, it seems not unlike it, both in figure and description.

EASTERN BLACK C. Cuculus Orientalis, Lin. Syst. i. p. 168. No z.

Description.

SIZE of a Pigeon: length fixteen inches. Bill grey brown: general colour of the plumage black, gloffed with green, and in some parts with violet, especially under the tail, which is eight inches in length: legs grey brown: claws black.

PLACE.

Inhabits the East Indies.

10. Var. A. Le Coukeel, Buf. ois. vi. p. 383. le second.

Description.

SIZE of our Cuckow: length fourteen inches. The bill is black, with a yellow tip: the whole plumage blackish, glossed with blue: the first quill feather is half as short again as the third, which is the longest of all. It carries the tail spread for the most part.

PLACES

Inhabits Mindanao.

Cuculus

Cuculus niger, Lin. Syst. i. p. 170. N° 12: Le Coucou noir de Bengale, Bris. orn. iv. p. 141. N° 17. Le Coukeel, Bus. ois. vi. p. 384. le troisseme. Black Indian Cuckow, Edw. pl. 58.

10. Var. B.

DESCRIPTION-

SIZE of a Blackbird: length nine inches. Bill bright orange, shorter and thicker than in the common Cuckow: the whole bird of a black colour, glossed with green and violet: the tail is wedged in shape, and four inches and a half in length: legs of a reddish brown: claws blackish.

reddish brown: claws blackish.

Inhabits Bengal, where it is called Coukeel, no doubt from its imitating that word.

PLACE.

+ CRESTED BLACK

ENGTH twelve inches and a half. Bill an inch and a quarter long, and pretty much curved; the colour of it black: the feathers of the head are an inch in length, forming a crest: general colour of the plumage glossy black, except the base of the four or five first quills, which are white, and form a spot of that colour on the outer edge of the wing: the tail is cuneiform; the two

middle feathers feven inches long; the outer feathers only four inches and a half: the thigh feathers are pretty long, and hang a

good way over the legs, which are black.

DESCRIPTION.

This inhabits the Cape of Good Hope, and is in the collection of Sir Joseph Banks. I am also in possession of a very perfect one; but it is rather less, and the tail not so long in proportion. They are so alike, that I am clear they only differ in age or sex.

PLACE.

This bird is likewise in the Cabinet du Roi. Buffon * observes,

that in this specimen the tail feathers were not regularly cuneated, all but the two outer ones being equal, and those alone an inch and a half shorter than the rest.

COROMANDEL CRESTED C.

Le Jacobin huppé de Coromandel, Buf. ois. vi. p. 380.—Pl. enl. 872.

DESCRIPTION.

ENGTH eleven inches. Bill black: head crefted like the last: the upper parts of the body black; the under white: on the edge of the wing a spot of white, in the same place as in the last species: tail cuneiform, tipped with white: the wings reach half way of the length of it: legs brown.

PLACE.

From the coast of Coromandel. Buffon supposes this and the last mentioned to vary only from climate.

PISAN C. Le Coucou huppé noir & blanc, Buf. oif. vi. p. 362. Cuculus ex albo & nigro mixtus, Ornith. Ital. t. 1. p. 81.

DESCRIPTION.

A LITTLE larger than our Cuckow. Bill of a greenish brown: the head is black, and ornamented with a crest, which falls behind: the upper parts of the body are black and white: throat, breast, and under tail coverts, rusous; the rest of the under parts white: quills rusous, tipped with white: tail black, with a white tip; the seathers of it longer in proportion than in our species, and more cuneated than in the great spotted Cuckow, N° 3, to which in other things it bears some affinity: legs green.

PLACE.

A male and female of these birds were found near Pisa, in Italy, where they made their nest, laying four eggs, sat on, and hatched

hatched them. It was observed that this species had never made its appearance there before; nor was it known from whence these birds came.

Le Coucou verdatre de Madagascar, Buf. ois. vi. p. 364.-Pl. enl. 815.

GREAT MADAGASCAR C.

DESCRIPTION.

HIS is of a large fize: length twenty-one inches and a half.

Bill an inch and three quarters, and black: irides orange: upper parts of the body deep olive, obscurely waved with deep brown: throat light olive, tinged with yellow: breast and upper part of the belly sulvous; lower part of the last, and under tail coverts, brown: thighs greyish ash-colour: tail ten inches long; some of the side feathers tipped with white: the wings reach two inches further than the base of the tail: the legs are yellowish brown.

Inhabits Madagascar.

PLACE.

VAR. A.

Description.

A SECOND of these birds was full as big as a Fowl, and near half an inch longer than the other. On the head was a naked blueish space, somewhat surrowed, and encircled with black feathers; those of the head and neck were soft and silky: the base of the bill bristly: inside of the mouth black: the tongue black and sorked: irides reddish: thighs, and insides of the wings, blackish: legs black. This bird had the property of turning the outer toe forwards as well as behind. It was supposed to be the male of the former, as it was seen in company of the others.

MADAGASCAR CRESTED C. Cuculus cristatus, Lin. Syst. i. p. 171. N° 19. Le Coucou hupé de Madagascar, Bris. orn. iv. 149. N° 22. t. 12. f. 2. Le Coua, Bus. ois. vi. p. 365. N° 4. t. 16. Coucou huppé de Madagascar, Pl. enl. 589.

DESCRIPTION.

IZE of a Jay: length fourteen inches. Bill above an inch long, black: irides orange: the head and upper parts of the body are of an elegant ash-colour, inclining to green: the feathers on the head are long, forming a crest: throat and fore part of the neck cinereous: lower part of the neck and breast vinaceous: belly and sides whitish, with a tinge of rusous: under tail coverts rusous white: thighs white, marked with bars of light ash: quills pale green, with a gloss of blue and violet; beneath cinereous: tail much the same; the side feathers tipped with white; the two middle feathers rather longest: legs black.

PLACE.

Inhabits Madagafcar; where it is called Coua. M. Commerfon, by whom a description of the bird was sent to Buffon, adds, that it carries its tail spread: that the neck is short: the nostrils bare, obliquely placed: tongue pointed, and cartilaginous: the cheeks bare, wrinkled, and white: and adds, that the flesh is good to eat; and frequents the woods about Fort Dauphin.

EGYPTIAN C.

Le Houhou d'Egypte, Buf. ois. vi. p. 367.

DESCRIPTION. FEMALE.

ENGTH between fourteen and fixteen inches. Bill an inch and a quarter long, or more, and black: irides bright red: the head and hind part of the neck dull green, with a gloss of polished steel, and the feathers stiff in their texture: upper wing

coverts rufous, inclining to green: quills rufous, terminated with shining green, except the three last, which are wholly of this colour, and the two or three preceding them, which are of a mixed colour: the back is brown, with a tinge of green: rump, and upper tail coverts, brown: tail cuneated, eight inches in length, of a shining green, with a gloss of polished steel: throat, and under parts of the body, rufous white, palest on the belly: legs blackish.

This description taken from a female. The bird is seen frequently in the Delta, in Egypt; where it is called by the Arabs, Houbou, repeating that word several times together. The male and semale are seldom as afunder; but it is rarely that more than two are seen together. Locusts are their principal food. They are seldom seen on large trees, nor often on the ground; but chiefly frequent low bushes near running water.

PLACE AND MANNERS.

Coucou des Philippines, Buf. ois. vi. p. 369.-Pl. enl. 824.

16. Var. A.

HIS is fo like the last, that one description might serve. The wings only in this are rusous, and all the rest of the plumage shining black.

Male.

Buffon seems to think this the male of the last.

Coucou vert d'Antigue, Son. Voy. p. 181. pl. 80.

16. Var. B.

ESS than a Cuckow. Irides black: eyelids furnished with hairs like eyelashes: head, neck, breast, and belly, dull green, almost black: wings of a deep red brown: the feathers in general

DESCRIPTION.

general hard and stiff; the webs loose, and each of the beards furnished with shorter ones: the legs are black: the inner hind claw is said to be more slender than the rest; but it is not mentioned whether it is strait or longer: neither is the tail said to be wedge-shaped; nor does the figure express it. M. Sonnerat only says, it is long and black: however, this might easily have escaped the pencil of the draughtsman. M. Sonnerat has said sull enough to make us suppose it the same, or a trissing variety of the last mentioned.

LONG-HEELED C. Le Coucou de Madagascar, Bris. orn. iv. p. 138. Nº 16. pl. 13. f. 2:—
Bus. ois. vi. p. 369. pl. 17.
Coucou de Madagascar, appellé Toulou, Pl. enl. 295. f. 1. la semelle.

DESCRIPTION.

SOMEWHAT bigger than a Blackbird: length fourteen inches and a quarter. The bill is brown, an inch and a quarter in length: head, throat, hind part of the neck, and upper part of the back, covered with longish, narrow, stiff feathers, of a blackish colour, with a rufous-white stripe down the shaft; those on the throat, fore part of the neck, and breast, the same, but have only a longitudinal stripe on each side: lower part of the back, rump, belly, sides, thighs, upper and lower tail coverts, greenish black: scapulars, upper and under wing coverts, sine chestnut; shafts of them and the scapulars purplish: quills chestnut, tipped with brown: the tail eight inches or more in length; of a blackish green above, and black beneath; in shape cuneiform: legs and claws black: the claw of the inner hind toe three quarters of an inch in length, and almost strait, like that of a Lark.

Inhabits *Madagascar*, where it is called *Tolou*. From the great similarity this has to the *Houkou*, it is probable that it may be a young one of that bird.

PLACE.

Cuculus Senegalensis, Lin. Syst. i. 169. No 6. Le Coucou du Senegal, Bris. orn. iv. p. 120. No 7. t. 8. f. 1.—Pl. enl. 332. Le Rusalbin, Bus. ois. vi. p. 370. STRAIT-HEELED C.

IN bulk it exceeds our Cuckow: length fifteen inches and a quarter. General colour brownish, inclined to rusous above, beneath dirty white: the bill is black, fifteen lines long: the upper parts of the head and neck are covered with blackish feathers, the middle and shafts of which are deepest: cheeks, throat, fore part and sides of the neck, are dirty white, with the shafts of a brighter colour: rump and upper tail coverts brown, with transverse deep brown striæ: the under parts from the breast dirty white, with very obscure transverse striæ: under tail coverts the same, but the striæ more manifest: quills rusous, with brownish tips: tail eight inches long, cuneated, and of a black colour: legs and claws greyish brown; the inner hind claws more than sive lines long, strait, like the hind claw of a Lark.

Description.

Inhabits Senegal.

PLACE.

Lark-heeled Cuckow, Brown. Ill. p. 26. t. 13.

LARK-HEELED

IN fize fomewhat larger than a Lark. Bill dusky: head, neck, back, and wing coverts, ferruginous, marked with short lines of white, bounded by black, pointing downwards: belly yellowish brown: the first and second of the prime quills plain reddish brown; the rest barred with black: tail very long, and cuneiform;

DESCRIPTION ..

. 526

form; outer feathers dusky, with brown tips; the others marked with bars of black, and narrow ones of brown: legs black: the inner hind toe has a long strait claw like a Lark.

PLACE.

Inhabits Bengal.

The three last seem to bear affinity to each other, though the produce of different countries; the general mark of the neck and head feathers having the longitudinal stripe in the middle, and all of them the heel of a Lark.

SACRED C. Cuculus honoratus, Lin. Syft. i. p. 169. N° 7. Le Coucou tacheté de Malabar, Brif. orn. iv. p. 136. N° 15. pl. 11. A. f. 2.—Pl. enl. 294. Le Cuil, Buf. oif. vi. p. 375.

DESCRIPTION.

and a half. General colour blackish ash on the upper parts, marked with two spots of white on each feather; beneath white, transversely spotted with ash-colour: quills cinereous, transversely spotted with white: tail much cuneated, five inches and a half long, and of the same colour as the quills; the outer feather only three inches long: legs and claws pale ash-colour.

PEACE.

Inhabits *Malabar*, where the natives hold it facred. It feeds on reptiles, which, perhaps, may be fuch as are the most noxious; if so, this feeming superstition may have rise from a more reasonable foundation than many others of the like fort.

Le Coucou brun & jaune à ventre rayé, Buf. ois. vi. 379. Coucou à ventre rayé de l'Isle de Panay, Son. Voy. 120. t. 79.

PANAYAN C.

DESCRIPTION.

THIS bird is equal in fize to our Cuckow. The bill is black: the irides orange: throat and fides of the head the colour of wine-lees: upper part of the head blackish grey: back and wings dull brown black: under part of the quills, nearest the body, spotted with white: tail black, even at the end, barred and tipped with white: breast dull yellow colour: belly light yellow: both breast and belly barred with black: legs reddish.

Inhabits the Isle of Panay, one of the Philippine Islands.

PLACE.

Le petit Coucou à tête grise & ventre jaune, Buf. ois. vi. 382. N° 15. Le Coucou petit de l'Isle de Panay, Son. Voy. p. 122. t. 81.—Pl. enl. 814. YELLOW-BELLIED ·

SIZE of a Blackbird; not indeed fo thick, but longer: length more than eight inches. Bill pale yellow; point black: upper part of the head and throat light grey: irides yellow: hind part of the neck, the back, and wings, are of an umber-colour, or light brown: belly, thighs, and under tail coverts, pale yellow, with a tinge of rufous: tail wedged, more than half the length of the bird, black, barred with white: legs pale yellow.

Description.

Inhabits the Isle of Panay.

PLACE.

Le Coucou vert doré & blanc, Buf. ois. vi. p. 385. Coucou vert du Cap de Bonne Esperance, Pl. enl. 657.

GILDED C.

SIZE of a small Thrush: length seven inches. Bill seven or eight lines long, and of a greenish brown colour: the upper

DESCRIPTION,

parts,

parts, from head to tail, are of a rich, gilded, gloffy green: on the head are five stripes of white; one on the middle of the forehead; two others above the eyes, in shape of eyebrows, passing behind; and two more, narrower, and shorter, beneath the eyes: most of the wing coverts, and the second quills, are tipped with white; as are the tail feathers, and the two greater tail coverts: the two outer tail feathers, and the outermost quill, marked with small spots of white on the outer edge: throat and under parts white; the sides, and feathers which fall over the knees, marked with a few greenish bars: legs grey: shins covered as far as the middle with white seathers: the length of the tail is more than three inches, cuneated, and, in its natural state, spread out like a fan; it is an inch and a quarter longer than the wings; and seems longer in proportion, in this bird, than in most of the other species.

PLACE.

This inhabits the Cape of Good Hope; and, when in fine plumage, there is not a more beautiful bird.

24. SHINING C. PL. XXIII. DESCRIPTION.

SIZE of a small Thrush: length seven inches. Bill blueish: irides hazel: the upper part of the body green, with a rich gilded gloss; the under parts white, transversely waved with green gold: the under tail coverts almost white: the quills and tail dusky-brown; the last short, and but very little exceeding the wings in length: the legs blueish.

PLACE.

This inhabits New Zealand, where it is called Poopo-arowro.— It should seem to have some affinity to the last; but it has no stripes of white on the head, nor blotches of white on the upper parts of the body: the tail too is much shorter than in that species. I believe it to be altogether new. I am indebted for the figure I now give of it to the drawings of Sir Joseph Banks.

Cuculus Coromandus, Lin. Syst. i. p. 171. Nº 20. Le Coucou hupé de Coromandel, Bris. orn. iv. p. 147. Nº 21. pl. 11. A. f. 1.—Pl. enl. 274.

COLLARED C.

Le Coucou huppé à collier, Buf. oif. vi. p. 388.

SIZE of a Missel-Thrush: length twelve inches and a half. Bill near an inch long, a little bent, and of an ash-colour: irides yellowish: the head is crested: that, and the upper part of the body, are blackish: on each side of the head, behind the eye, is a small, round, grey spot: the upper part of the neck is surrounded with a white collar, a quarter of an inch in breadth: the throat and thighs are blackish: the fore part of the neck, breast, belly, and under tail coverts, white: scapulars and wing coverts are blackish in the middle, edged with rusous; but the greater coverts, farthest from the body, rusous: prime quills the same; but the

Description-

fecondaries are blackish, edged with rusous: the tail is blackish, and cuneiform: legs ash-colour.

PLACE.

Inhabits the coast of Coromandel.

HORNED C. Cuculus cornutus, Lin. Syst. i. p. 171. N° 21. Le Coucou cornu du Bresil, Bris. orn. iv. p. 145. N° 20. L'Atingacu du Bresil, Buf. ois. iv. p. 409. Atinga guacu mucu, Will. orn. 198. t. 38.—Raii Syn. 165. N° 20.

DESCRIPTION.

SIZE of a Thrush: total length twelve inches. The bill as little bent at the end, of a greenish yellow: irides sanguineous: the head, and all the parts above, are the colour of soot: on the head the seathers are long, forming a double crest, resembling horns, which it can erect at will: parts beneath cinereous: quills and tail soot-colour; the last darkest, nine inches in length, and tipped with white; the two middle seathers longest; the outer ones very short: legs and claws ash-colour, covered before with seathers half way.

PLACE.

Inhabits Brasil.

Willughby ranks it with the Thrushes, and says, the toes are disposed after the usual manner; yet in the figure they are placed two and two: therefore Brisson, and others after him, more properly place it with the Cuckow.

28. CHINESE C. Cuculus Sinenfis, Lin. Syft. i. p. 171. No 16. Le Coucou bleu de la Chine, Bris. orn. iv. p. 157. No 277 to 14. A. fig. 22. San-hia de la Chine, Bus. ois. vi. p. 389.

Description.

IZE of a Blackbird: length thirteen inches. Bill eleven inches long, red; the upper mandible befet with briftles, turned forwards: irides red: the top of the head is white, marked with small

finall blue fpots: the rest of the head, and the throat, are blackish: on each side of the head, behind the eye, is a round white spot: hind part of the neck, back, scapulars, and upper tail coverts, sine blue: greater wing coverts, farthest from the body, white: rump very pale blue: upper tail coverts of the same colour as the back, with a white spot near the end: parts beneath snow white: quills half pale and half deep blue: tail feathers deep blue, with a roundish white spot near the end of each; the two middle feathers exceed the next in length, by three inches and a quarter; the two outer ones only one inch and three quarters long: legs and claws red.

Inhabits China.

PLACE.

Neither Linnaus, Brisson, nor Busson appear to have seen this bird, but are indebted to the pencil of M. Poivre for it.

Scopoli observes, that it is apt to vary in colour; and that it has a notch at the end of the upper mandible, as in the Shrike.

Klein. * fays, it is a native of Guinea, in the more northern parts, as well as those bordering on the Cape of Good Hope.

That in *Pl. enl.* is white round the eye, and has a streak behind it: crest tipped white, and half erect: only the middle quills red: thighs and vent black: legs black.

Description.

Male.

SIZE of a large Pigeon: length fifteen inches. Bill two inches long, blackish, and more strait than usual in this genus: the head, throat, and neck, are cinereous: crown of the head blackish, glossed with green and copper: from the bill to the eye, on each side, is a stender black line: the back, rump, scapulars, and upper wing and tail coverts, green, glossed with copper: breast, belly, sides, thighs, under wing and tail coverts, bright grey: greater quills blackish; the lesser quills dull green, with a fine green and copper gloss: the tail is composed of twelve feathers, of equal lengths, above copper and green-gold, beneath black: the less reddish: claws black.

Vак. А.

Le grand Coucou de Madagascar, Bris. orn. iv. p. 162. pl. 15. f. 2.—P. enl. 588.—Buf. ois. vi. p. 396.

Description.

THE female is bigger than the male: and is in length feventeen inches and a half. The bill is two inches and one-thirds in length, and of a brown colour: head, throat, and hind part of the the neck, transversely striped with brown and rusous: back and rump brown: the upper tail coverts, fore part of the neck, the breast, belly, sides, and under tail coverts, incline to rusous, with a blackish spot near the end of every feather: thighs and under wing coverts plain: lesser wing coverts, above, brown tipped with rusous; the greater ones brown within, and dull green on the outer edge, margined and tipped with rusous: quills as in the male, but duller: tail fine brown above, somewhat rusous at the tips: legs reddish: claws blackish.

Both these inhabit Madagascar, where the male is called Vourougdriou, and the semale Cromb. They differ so much, as to be taken by the natives for distinct species. PLACE

Le Coucou indicateur, Buf. oif. vi. p. 392. N° 22. Cuculus indicator, J. Fr. Miller miscell. fol. tab. xxiv. fig. A. Honey Guide, Phil. Trans. vol. lxvii. p. 38. pl. 1.

HONEY.

ENGTH seven inches. Bill half an inch long, thickish; brown towards the base; at the tip luteous; the base beset with a sew bristles: irides ferruginous grey: eyelids naked, black: top of the head grey; the seathers broadish and short: chin, throat, and breast, dirty white, with a tinge of green on the last: back and rump ferruginous grey: belly and vent white: thighs white, with a longitudinal streak of black on each seather: upper wing coverts grey-brown, some of them tipped with yellow, forming a yellow spot on the shoulders, which is, for the most part, covered by the scapulars: quills, above, brown; beneath, grey-brown: bastard wing grey-brown: tail cuneiform, composed of twelve feathers, the two middle ones narrowest; both above and beneath rusty brown; the two next, on each side, suliginous; the inner margins whitish.

DESCRIPTION:

whitish; the two following, on each side, white, with brown tips, and a black spot on the inner webs at the base; the outer one shorter than the rest, much as the last, but the black spot at the base not very conspicuous.

MANNERS.

The manners of this bird are fingular, and worth notice.— It is supposed to feed principally, or at least to be very fond of, honey; and is of use, by its wonderful instinct, for finding out the places where the wild Bees hoard it up; which it discovers to the Hottentots and Dutch in the following manner: The morning and evening are the times of feeding; and it has a shrill note, which the Honey-hunters carefully attend to, and answer, from time to time, till they have the bird in fight; on which it flies to the spot where the bees have placed their store; after taking of which, they leave their guide a portion for his pains. Dr. Sparrman, who furnished this account, assures us, that he has several times been at the taking wild Bees nefts in this manner; but could only obtain two specimens, both females; from which this description was taken. It should seem, that this bird is held in great veneration by the Hottentots; as he adds, that his killing them was attended with the greatest indignation of those people.

PLACE.

This curious bird is an inhabitant of the interior parts of Africa, at a good distance from the Cape of Good Hope.

NEST.

: 1

A neft which was shewn to *Dr. Sparrman*, for that of this bird, was composed of slender silaments of bark, woven together in the form of a bottle; the neck and opening hung downwards, and a string, in an arched shape, was suspended across the opening, sastened by the two ends, perhaps for the bird to perch on.

Cuculus

Cuculus vetula, Lin. Syft. i. p. 169. No 4.

Another fort of Old Man, or Rain Bird, Sloane Jam. p. 313. No 53. pl. 258. f. 2.

THIS is a trifle bigger than a Blackbird: length more than fifteen inches. Bill above an inch and a half long: the upper mandible black; the lower whitish: crown of the head brown, the feathers of it soft and silky: the upper parts of the body, and the quills, cinereous olive: throat and fore part of the neck whitish; the rest of the under parts rusous: the tail is much cuneated; the two middle feathers cinereous olive, the others dusky black, tipped with white; the outer feather very short: legs blue-black.

Inhabits Jamaica, where it is frequent in the woods and hedges, all the year round. It feeds on feeds, small worms, and caterpillars, and is very tame. Sloane mentions, that he found, on diffection, the stomach of a great size, in respect to that of the bird; a circumstance I have more than once observed in the European Cuckow.

This bird has the name Tacco from its cry, which is like that word; the first syllable of this is pronounced hardly, the other following in a sull octave lower than the first. It has also another cry, like qua, qua, qua, but that only when alarmed by an enemy. As well as insects, it will also eat Lizards, small Snakes, Frogs, young Rats, and, sometimes, even small Birds. The Snakes

LONG-BILLED RAIN: C.

DESCRIPTIONS

PLACE AND MANNERS.

they swallow head foremost, letting the tail hang out of the mouth till the fore parts are digested. This bird, it is most likely, might be easily tamed, as it is so gentle as to suffer the negro children to catch it with their hands. Its gait is that of leaping, like a Magpie, frequently being seen on the ground; and its slight but short, chiesly from bush to bush. At the time when other birds breed, they likewise retire into the woods, but their nests have never yet been found; from which one should be inclined to think, that they were indebted to other birds for the rearing their young, in the manner of the common Cuckow. It has the name of Rain-bird, as it is said to make the greatest noise before rain. Common all the year at Jamaica.

RAIN C. Cuculus vetula, Lin. Syft. i. p. 169. N° 4.

N° 52. p. 258. f. 1.—Brown. Jam. p. 476.

DESCRIPTION.

SOMEWHAT less than a Blackbird: length from fifteen to seventeen inches. Bill an inch long: the upper mandible black, the under whitish: the top of the head is covered with downy soft feathers of a deep brown: the rest of the upper part of the body, the wings, and two middle tail feathers, cinereous olive: the throat and fore part of the neck are white; which, especially that on the throat, appears like a downy beard*: the breast, and the rest of the under parts of the body rusous: all the tail feathers, except the two middle ones, are black, tipped with

^{*} Whence, perhaps, the name of Old Man.

white, and the outmost one margined with white: the legs are of a blueish black.

This likewise inhabits Jamaica with the last. Both are known by the name of Old Man, or Rain-bird.

PLACE.

Le petit Vieillard, Buf. ois. vi. p. 401. Coucou des Paletuviers de Cayenne, Pl. enl. 813.

MANGROVE C.

THIS and the Rain-bird of Jamaica, are faid to be so like each other, especially the semale of the last, both in colour, shape, &c. that one description may serve; but this is much less, and the tail is shorter in proportion. It is about twelve inches long. The bill as in the last; as are the upper parts of the body and tail: the irides yellow: the chin is white: the rest of the parts beneath pale rusous: the legs seem longer than in the last.

DESCRIPTION.

It inhabits Cayenne, and lives on infects, especially those large caterpillars which, feed on the leaves of the mangrove; for the purpose of which, these birds frequent the places where such trees grow, and are principally found there.

under one yellowish: the upper parts of the body are cinereous olive; the under parts white: the quills are pale rusous: the tail is cuneated, fix inches long; the two middle feathers of the same colour as the back; the others black, tipped with white: legs and claws grey brown.

PLACES.

This inhabits Carolina in the fummer-time, where it frequents the deep thick woods.

I have also received it from Jamaica, where I am told it is common. Notwithstanding the sentiments of Buffon, I have some doubt whether this is not the other fort of Rain-bird of Sloane; or that his two are but one species, as Linnaus supposes. I have never seen but one of the large fort, which answered to the first-mentioned, or that with the long bill.

BRASILIAN CRESTED C. Le Coucou hupé du Bressl, Bris. orn. iv. p. 144. Nº 19. Le Guira cantara, Bus. ois. vi. p. 407. Guira acangatara, Raii Syn. p. 45. N° 5.—Will. orn. 140. N° 9. t. 22.

DESCRIPTION.

SIZE of a Magpie: length fourteen inches and a half. Bill dullish yellow, an inch long; the upper mandible a little hooked: irides brown: the whole head covered with feathers, which are brown down the middle, and yellowish on the sides: those of the throat and neck, on the contrary, are yellowish down the middle, and brown at the sides: back, rump, breast, belly, sides, thighs, upper and under tail coverts, and beneath the wings, pale yellowish white: feathers on the crown longish, forming a crest: quills and tail brown; the last tipped with white: legs fea-green.

PLACE.

Inhabits Brasil, where it makes a great cry in the woods. This

IO

is

is faid to have but, eight feathers in the tail; but, as I never heard of any bird which had fewer than ten, I shall wait for further confirmation of this circumstance before I give credit to it.

Le Coucou du Mexique, Bris. orn. iv. p. 119. N° 6. Le Quapactol, ou le Rieur, Bus. ois. vi. p. 408. N° 4. The Laughing Bird, or Quapactototl, Will. orn. 387.—Raii Syn. p. 174. LAUGHING C.

ENGTH fixteen inches. Head and parts above fulvous: bill blueish black: irides white: throat, fore part of the neck, and breast, cinereous: belly, sides, thighs, and under tail coverts, black: tail of a blackish sulvous colour, half the length of the bird.

Description.

Inhabits Mexico. The cry of this bird is like that of human laughter; on which account it is dreaded by the *Indians*, as inaufpicious and ominous, foreboding fome evil or mischief.

PLACE.

Cuculus nævius, Lin. Syst. i. p. 170. N° 9. Le Coucou tacheté de Cayenne, Bris. orn. iv. p. 127. N° 11. pl. 9. f. 1. + SPO'C

Le Coucou brun varié de roux, Buf. ois. vi. p. 411.

SIZE of a Fieldfare: length ten inches and three quarters. Bill three quarters of an inch; the upper mandible black on the top, and rufous on the fides; the under wholly rufous: general colour of the plumage rufous in two shades; the under parts rufous white: the feathers on the crown are of a deep brown, and pretty long, with rufous tips, and some of them margined with rufous: hind part of the neck rufous grey; down the shafts deep

Description.

3 Z 2 -

brown:

brown: back and rump the same; each feather tipped with a rusous spot: on each feather of the throat and neck is a transverse brownish line near the end: the under tail coverts are rusous: quills grey brown, edged with rusous, and a spot of the same at the tips: tail near six inches long, much cuneated; the outer feathers only half the length of the middle ones; colour of it the same as the quills; some of the upper coverts reach to near two-thirds of the length of the tail: the legs are ash-colour: claws greyish brown.

PLACE.

Inhabits Cayenne.

A VARIETY.

Buffon mentions a variety of this by the name of Rail-bird*. It is much the same in size, but has less rusous, being grey in the place of that colour: the side tail feathers have white tips: the throat pale grey: under the body white: the tail a trifle longer than in the other. Whether a variety or different sex not known.

PLACES.

This is common at Cayenne and Guiana; and is feen often perched upon gates and rails, whence its name; and when in this fituation continually moves its tail. These are not very wild birds, yet do not form themselves into troops, although numbers are often found in the same district: nor do they frequent the thick woods like many of the genus.

The first of these I am in possession of, but the Variety I have never seen. I am clear that my specimen totally differs from the sollowing, both in length and size, however the descriptions may seem to coincide.

PUNCTATED

DESCRIPTION.

ENGTH nine inches. Bill near one inch long, bent, and of a black colour: the head, neck, and upper parts of the body, are brown, and fomewhat gloffy; every feather marked with a pale rufous fpot at the tips: the wings and tail are brown, but darker than the rest; and the feathers spotted at the tips like the others: the upper tail coverts reach a great way on the tail, which is cuneiform in shape: the belly and vent are dirty white: the legs are pretty long, and of a brown colour.

This, most likely, inhabits Cayenne, as I saw it among various other birds from that part.

PLACE.

Cuculus Dominicus, Lin. Syst. i. p. 170. N° 13. Le Coucou de St. Domingue, Bris. orn. iv. p. 110. N° 2. Le Cendrillard, Bus. ois. vi. p. 413.

ST. DOMINGO C.

DESCRIPTION.

SIZE of a Thrush: length ten inches and a half. Bill an inch and a quarter long, grey brown: plumage above grey brown; beneath pale ash-colour: quills rusous, tipped and margined with grey brown: tail cuneated, five inches and a quarter long; the two middle feathers as the back; the others black, with white tips; and the outer one white on the outer margin: legs and claws grey brown.

Inhabits Guiana, St. Domingo, and Louisiana.

PLACES.

Buffon mentions one which was in the collection of M. Mauduit, of Paris, and was rather bigger. The under parts were wholly white, and the bill not fo long as that of the other.

A VARIETY.

Cuculus

542

CAYENNE C. Cuculus Cayanus, Lin. Syst. i. p. 170. No 14.

Le Coucou de Cayenne, Bris. orn. iv. p. 122. No 8. pl. 8. f. 2.—Pl. enlum. 211.

Le Coucou piaye, Buf. ois. vi. p. 414.

DESCRIPTION.

SIZE of a Blackbird: length fifteen inches and three quarters. The bill is grey brown, above an inch long, and a little bent at the tip: the plumage on the upper parts of the body purplish chestnut; beneath the same, but paler: quills the same as the upper parts, tipped with brown: tail the same; near the end black, and tipped with white; it is much cuneated, and above ten inches long: the legs and claws are grey brown.

PLACE AND MANNERS. This inhabits Cayenne, where it goes by the name of Piaye, or Devil. The natives give it that name, as a bird of ill omen. The flesh they will not touch, and indeed not without reason, as it is very bad and lean.

It is a very tame species, suffering itself to be almost touched by the hand before it offers to escape. Its slight is almost like that of a Kingsfisher; frequents the borders of rivers, on the low branches; feeds on insects; often wags its tail on changing place.

VAR. A.

Cuculus Cayanensis minor, Lin. Syst. i. p. 170. No 14. s. Le petit Coucou de Cayenne, Bris. orn. iv. p. 124. No 9. pl. 16. f. 2.

DESCRIPTION.

SIZE of a Missel Thrush: length ten inches and a half. Bill grey brown: head and upper parts purplish chestnut: throat to the breasst the same, but paler: belly, sides, and thighs, brown ash:

ash: under tail coverts deep chestnut brown: quills and tail as the upper parts; the first tipped with brown, the last with white, and much cuneated: legs and claws grey brown.

VAR. B.

BUFFON mentions likewise another variety, with a red bill: an ash-coloured head: throat and breast rusous: and the rest of the under parts cinereous black.

DESCRIPTION.

Inhabits Cayenne.

PLACE.

Le Coucou noir de Cayenne, Buf. oif. vi. p. 416.-Pl. enl. 512.

CAYENNE BLACK C.

ENGTH eleven inches. Bill ten lines in length, and of a red colour: irides red: general colour of the plumage black: the parts beneath less dark than those above, inclining to ash: upper wing coverts bordered with white: tail a little wedge-shaped, and exceeds the wings, when closed, about three inches. This bird is said to have a tubercle at the fore part of the wings.

DESCRIPTION.

It is a folitary filent bird; for the most part being found perched on trees which grow near the water, and is not near so restless as the major part of the *Cuckow* tribe; by which it may seem somewhat allied to the *Barbet*.

MANNERS

Inhabits Cayenne.

PLACE.

544

WHITE-RUMPED BLACK C.

DESCRIPTION.

Le petit Coucou noir de Cayenne, Buf. ois. vi. p. 417.-Pl. enl. 505.

ENGTH eight inches and a quarter. Bill above an inch, and dusky. This bird is wholly black, except the lower part of the back and rump, the belly, thighs, and vent, all of which are white: on the belly the white is separated from the black by a kind of orange band: tail scarcely three inches long, cuneated, and exceeds the length of the wings but very little: the legs are yellow.

PLACE AND MANNERS.

This too inhabits Cayenne. In manners it imitates the last, as well as the places it is found in. It passes the day perched on a solitary branch of a tree, in an open spot, without any motion, except what is merely necessary in collecting the insects on which it feeds. It builds in the hole of a tree, and sometimes in a hole in the ground, if it finds one already made.

RED-HEADED C.

Red-headed Cuckow, Ind. Zool. t. 6.

DESCRIPTION.

ENGTH fixteen inches: weight four ounces. Bill much arched, strong, and of a greenish yellow colour: crown and part of the cheeks bright crimson, entirely surrounded by a band of white: hind part of the head and neck black, marked with small spots of white: fore part of the neck entirely black: back and wings black: tail very long, unequal, the lower part black; ends white: breast and belly white: legs pale blue.

PLACE.

Inhabits Ceylon, where it is called Malkoba. Lives on fruits.

Cuculus

Cuculus Brafiliensis, Lin. Syst. i. p. 171. N° 18. Le Coucou rouge hupé du Bresil. Bris. orn. iv. p. 154. N° 25. Le Couroucoucou, Bus. ois. vi. p. 298. Cuculus Brasiliensis, venustiss. pictus, Seba. vol. i. 102. t. 66. f. 2.

RED-CRESTED

HIS is fomewhat less than the former: length ten inches. Bill a little bent; half an inch long, and of a light red colour: the head is of a pale red, and adorned with a creft of a deeper red, variegated with black: parts above deep red; beneath pale red; with a tinge of yellow on the belly: upper wing coverts pale red, mixed with yellow: quills and tail yellow, with a shade of black.

DESCRIPTION.

Buffon remarks, that in Seba's figure, the toes are disposed three and one; but, as the name of Cuckow is given it, they should have been placed two and two.

Cuculus Persa, Lin. Syst. 171. No 17. Le Coucou verd hupé de Guinée, Bris. orn. iv. 152. No 24. Le Touraco, Bus. ois. vi. 300. t. 15. Le Touraco de Guinée, Pl. enl. 601. Crown Bird from Mexico, Albin. ii. t. 19. Touraco, Edw. i. t. 7. TOURACO

THIS bird is about the fize of a Magpie. The bill shortish; the upper mandible bent; colour reddish brown: nostrils covered by feathers: irides hazel brown: eyelids surrounded with red caruncles: the head, throat, neck, upper part of the back, breast, part of the belly, and the sides, are covered with soft

4A

Description.

filky

filky feathers of a fine deep green: the upper lesser wing coverts the same: the feathers on the crown lengthened into a crest, which the bird can erect at pleasure; the tip of this crest is reddish: on each side the head is a black stripe, broadest in the middle, arising at the corners of the mouth, passing through the eyes to the hind head: above and beneath this, is a narrow line of white: lower part of the back, rump, and upper tail coverts, scapulars, and greater coverts, are blueish purple: lower part of the belly, sides, thighs, and under tail coverts, blackish: greater quills crimson, with the outer edge and tip margined with black: tail blueish purple: legs and claws cinereous.

PLACE:

Inhabits various parts of Africa.

Buffon mentions two species; the first from Abyfinia, and the other from the Cape of Good Hope. The first has a blackish crest, hanging behind as a lock; the other has an upright crest of a bright green, with fometimes a mixture of white: the difference in plumage very trivial. One from the Cape, which he faw alive, was faid to feed on rice; yet, on trial, would by no means swallow a grain, it would have famished first; but eat the seeds of grapes. greedily, as also apples and oranges, and lived on fruits for several: months; by which it appeared, that fruits are its natural food, The progressive motion of this bird was not by walking, but leaping. After moulting, it got the white stripe above and beneath the eye; and the crest became all of one green colour: Several: of these birds have been alive in England, of which I have seen one: the description as above. The eye appeared uncommonly brilliant, the creft chiefly in an erected state; and the bird: very lively. It is faid by Albin to come from Mexico; but this may be doubted: Edwards expressly says, it comes from Guinea; and all which I have feen have been from that quarter.

GENUS XX. WRYNECK.

HE bill in this genus is roundish, slightly incurvated, and of a weak texture.

Nostrils bare of feathers, and fomewhat concave.

The tongue long, flender, and armed at the point.

Ten flexible feathers in the tail.

Feet made for climbing: toes placed two and two.

This genus confifts of only a fingle species, and has, by most authors, been held as distinct; for though it seems allied to some other genera, it perfectly coincides with none. It has the tongue of the Woodpecker, as well as the situation of the toes; but the weakness of the bill, unapt to bear the rude exertions of those birds, forbids it to be placed among them.—It seems also much allied to the Cuckow*, did not the length of tongue prove the contrary. It is a bird well known; but for form sake we proceed to describe it.

^{*} Linnaus, in his former edition of the Fauna Suecica, had there placed it with the Guckows.

DESCRIPTION.

HOUGH the colours are very few in this bird, nor at all gaudy, yet their being blended together in a most beautiful manner, gives it an elegant appearance. In fize it nearly equals a Lark: the length is feven inches. The bill is three quarters of an inch long, and of a pale lead-colour: irides hazel: the tongue is long, in shape like a worm when extended.—" Its plumage (fays Mr. Pennant) is marked with the plainest kinds: a list of black and ferruginous strokes divide the top of the head and the back: the fides of the head and neck are ash-coloured, beautifully traversed with fine lines of black and reddish brown: the quill feathers are dusky, but each web is marked with rust-coloured spots: the chin and breast are of a light yellowish brown, adorned with sharp-pointed bars of black: the tail confists of ten feathers, broad at their ends, and weak, of a pale ash-colour, powdered with black and red, and marked with four equidiftant bars of black."

FEMALE.

The female is paler in colour than the male. It builds in hollow trees, making no neft, but laying the eggs, which are from eight

The Hryneck.

eight to ten in number, on the bare rotten wood within; these eggs are as white as ivory *, according to Buffon.

This, as far as relates to England, is a bird of passage, coming eight or ten days before the Cuckow. We find it mentioned as an inhabitant throughout Europe, and of many parts of the old Continent. It is in Russia, Sweden, Lapland, Greece, Italy, Babylon, and Bengal; authorities for which Bussian mentions, and says, that at the end of summer this bird grows very fat, when it becomes excellent eating; for which reason, some have named it the Ortolan. Its food is chiefly ants, which the male has been observed to carry to the semale while sitting.—The young ones, while in the nest, will his like so many snakes; insomuch that many have been prevented plundering the old ones of their offspring, on supposition, that they were advancing their hands on the brood of this loathsome reptile.

PLACES.

Le Torcol rayé, Brif. orn. iv. p. 7.

Jyngi congener, Aldrov. av. i. p. 868. t. 869.—Will. orn. t. 22.

VAR. AS

THIS is faid to differ from the other, in manner following:

—The head and upper parts of the body are ferruginous, beautifully varied with transverse yellow spots: the under parts white, varied with longitudinal lines of yellow: the wings and tail the same colour with the back: legs yellow: claws black and hooked.

It is much to be doubted whether this is a different bird; it is more likely a variety of the common species above-mentioned.

• Mr. Pennant observes, that the shell is so thin that the yolk may be seen within. He also says, that it makes a nest of dry grass. Br. Zool. 8vo. p. 239.

Lev. Muf.

Description.

SIZE of a Jackdaw: length feventeen inches. Bill near two inches and a half in length; of a dark ash-colour, and whitish on the sides: irides pale yellow*: the whole bird is black, except the crown of the head, which is vermilion: the first quill feather is shortest: the two middle tail feathers longer than the others, making it appear a little rounded: the legs are lead-co-loured; covered with feathers on the fore part for half their length.

FEMALE.

The female differs from the male, in having the hind head only red, and not the whole crown of the head; and the general colour of the plumage has a strong cast of brown in it. It has likewise been observed, that the red on the hind head has been wholly wanting: and indeed both male and female are apt much to vary, in different subjects; some having a much greater proportion of red on the head than others.

PLACE.

This bird is found on the continent of Europe, but not in plenty, except in Germany. It is not an inhabitant of Italy, and

The eyelids are naked, according to Scopoli.

very rarely feen in France. Frisch mentions it as a bird common to his parts; and it is found also in Sweden, Switzerland, and Denmark*; but not in winter.

It is faid to build in old Ash and Poplar trees, making large and deep nests; and Frisch observes, that they often so excavate a tree, that it is soon after blown down with the wind; and, that under the hole of this bird may often be sound a bushel of dust, and bits of wood. The female lays two or three white eggs, the colour of which, as Willughby * observes, is peculiar to the whole of the Woodpecker genus, or, at least, all those which have come under his inspection.

White-billed Woodpecker, Amer. Zool. N°

WHITE-BILLED W.

THIS is bigger than the last, being equal in fize to a Crow: it is fixteen inches in length; and weighs twenty ounces. The bill is as white as ivory, three inches in length, and channeled: irides yellow: on the hind head is an erect pointed crest, of a fine red colour, some of the feathers being two inches long: the head itself, and body in general, are black; but the lower

Description.

· Zool. Danic.

† Om. p. 134.

part of the back, rump, and upper tail coverts, are white: from the eye arises a stripe of white, which passes on each side of the neck, quite down to the back: three or four of the prime quills are black; but the rest are white: the tail is cuneiform, the same colour as the body: the legs and claws also are black.

PLACE AND MANNERS. This bird inhabits Carolina, Virginia, New Spain, and Brasil, and is called by the Spaniards Carpenter; and not without reason, as this, as well as most of the other species, makes a great noise with the bill against the trees in the woods, where they may be heard at a great distance, as if Carpenters were at work; making, according to Catesby, in an hour or two a bushel of chips. He adds likewise, that the Canadian Indians make use of the bills of these birds for coronets, setting them round in a wreath, with the points outwards; and that the nort hern Indians purchase them of the southern, at the rate of two and three Buck-skins per bill.

Kalm fays, they are found in New Jersey, though very feldom, and only at certain seasons.

DESCRIPTION.

HIS is less than the last: length fifteen inches: weight nine ounces. The bill is two inches long, and of a lead-colour; as are the eyelids: the irides are the colour of gold: the top of the head adorned with a crest of long red feathers; beneath this,

OVCE

over the eye, is a streak of white; and again under this is a broader black streak, in which the eyes are placed; all of which marks tend to the hind head: on each side of the jaw is a stripe of red, which reaches the whole length of the lower mandible, and a little way down the neck: the cheeks, throat, fore part and sides of the neck, are of a pale yellow, or buff colour: in the middle of this colour is placed a band of black, which arises at the corners of the mouth, and passes down the sides of the neck: the hind part of the neck, back, and rump, are black: on the middle of the back is a spot of white; and another or two of the same, on the wings: the breast, belly, sides, thighs, and under tail coverts, are blackish: the tail itself unequal; the two middle feathers the longest: legs and claws black.

The female differs in having no red on the lower jaw, and the fore part of the head brown *; but has a red crest, as well as the male.

This bird is common in Louisiana, Carolina, and Virginia; and, according to Kalm; is frequent also in forests in Pensylvania, where it stays the winter. It is reckoned very hurtful to the Maize, as it settles on the ripe ears, and destroys them with its bill; not that it is known for certain, that these birds eat any

Female.

PLACES AND MANNERS.

^{*} Buffon mentions a black Woodpecker met with by M. Commerson, in the Straits of Magellan, of the fize of the common one, and otherwise like it, except having only the fore part of the head red, the hinder part crested, but black.

[†] Voy. i. p. 148.

[‡] Kalm adds, "That all the tribe of Woodpeckers are destructive to Maize, when it begins to ripen; for, by pecking holes in the membrane round the ear, the rain gets into it, and causes the ear, with all the corn it contains, to rot." Kalm. Trav. i. p. 148,

part of the grain; being more likely in fearch after some kind of insect that frequents the plant, rather than any part of the plant itself, as none of this genus are granivorous *. I am told, that this species is frequently met with in the *Pins forests*, and known, by some, by the name of *Woodcock*.

← LINEATED. W. DESCRIPTION.

thirteen inches and three quarters. Bill above an inch and a half long, and of an horn-colour: head and nape of a beautiful red, the feathers long enough to form a creft: along the under jaw a ftripe of the fame: upper parts of the body black: cheeks the fame, but inclining to ash: from the corner of the mouth, on each fide, is a line of white; which, growing broader as it advances downwards, meets on the middle of the back: beneath the throat is rusous white, the shaft of each feather dashed with black: fore part of the neck and breast black; each feather margined with rusous white at the tip: belly, vent, and thighs, rusous white, striated transversely with black: the edges of the wings, and beneath them, white: quills black; the inner webs, for one-third of their length from the base, white: tail cuneiform, black: legs and claws grey.

* Hift. des oif. vol. vii. p. 49.

Inhabits,

PLACE.

Inhabits Cayenne. I have ventured to place the Ipecu, as fynonymous with the above-described, rather than with the last but one, as Linnaus and Brisson have both done, for many reasons: the Ipecu is said to be as big only as the green Woodpecker, while the other is of the size of a Crow: secondly, the former has a horn-coloured bill, while that of the latter is as white as ivory, and twice as long: and thirdly, the under parts of the body, in this bird, are variegated; whereas in the white-billed they are plain.

Buffon thinks, that this may prove the Tlaubquechultototl of Fernandez*; and it may also be the bird meant by M. Ferminabove quoted, though this circumstance can only be guessed at, as he merely says, that it is black, with the top of the head cinnabar: as to the name Charpentier (or Carpenter) it is by no means characteristic; it being a common name given to the Woodpecker tribe in general, by the inhabitants of South America. There is also another black Woodpecker, copied from Seba; by Brisson; which is wholly of that colour, crossed with zigzag lines of light grey, on the wings and under parts. Buffon would have this rejected, not being certain of the genus, as well as two others, as Seba talks of their feeding on sish, and calls them Herons; but what they really are will perhaps never be determined.

RED NECKED

Le Pic à cou rouge, Buf. ois. vii. p. 53. Grand Pic huppé à tête rouge de Cayenne, Pl. enl. 612. Lev. Mus.

Description.

HE length of this bird is fixteen inches. The bill is of a pale colour: the whole head and neck, as far as the breaft, are crimfon: the back part of the head is crefted: the back, wings, and tail, are of a deep brown, with a little mixture of cream-colour on the wings: the under parts are of a deep cream-colour: the legs lead-colour.

PLACE.

The above description was taken from a fine specimen in the Leverian Museum, said to have come from Cayenne. Buffon calls the colour of the under parts of his bird sulvous, and says it also came from Cayenne. The difference is trisling; perhaps the variation may arise from difference of sex.

BUFF-CRESTED W. PL. XXV.

DESCRIPTION.

Lev. Muf.

ENGTH twelve inches and a half. Bill two inches, and of a brownish horn-colour. The whole head is crested, the fore part of which is black; the hinder part buff-coloured: under the crest, above the eye, is a line of black: the hind part of the neck, under the crest, is likewise black: the side of the head, under the eye, is white, which runs down in a line on each side the neck, and meets behind at the back, the upper half of which is likewise white: lower part of the back brown black: as are the sides of the head and neck, wings and tail: the chin is dusky: breast,

Pouff crested Woodpecker.

Breaft, belly, and vent, dirty white, transversely barred with dusky black: legs black.

Inhabits Surinam.

PLACE.

Picus hirundinaceus, Lin. Syft. i. p. 174. N° 5. Le Pic noir de la Nouvelle Angleterre, Bris. orn. iv. p. 24. N° 7. Le petit Pic noir, var. Buf. ois. vii. p. 54. Lesser black Woodpecker, Albin. iii. pl. 23.

- Am. Zool. No

LESSER BLACK

THIS is not much bigger than a Swallow: the length is five inches and a half. The bill an inch and a quarter long, and of a brown colour: irides whitish: the colour of the plumage, with a few exceptions, is black: the hind head is red: and the edges of the wings and bottom of the belly white: legs yellowish: claws black.

Description.

This species inhabits North America.

PLAGE.

Le petit Pic noir, Buf. ois. vii. p. 54.

de Cayenne, Pl. enl. 694. f. 2.

Lev. Mus.

VAR. A.

HIS is full as big as the last, being, according to Buffon, of the fize of the Wryneck. On the head is a red spot; over the eye a trace of white; and towards the hind head a few small yellow feathers: down the middle of the breast, as far as the belly, is a dash of red: belly and sides mixed black and grey: lower part of the back and rump white: the rest of the plumage and tail are black, with a blueish gloss on the head and body.

DESCRIPTION.

There

1

WOODPECKER.

There is also a variety of this, which wants the red spot on the head, but instead of it has a circle of yellow encompassing the head:

FEMALE.

The female has neither red nor yellow on any part of the head.

Description.

ENGTH eight inches and a half. Bill dusky, pale at the base: general colour of the plumage black: on the middle of the crown is a red spot: on the side of the head a bed of white, in which the eye is placed; this extends to the hind head, which is of a golden yellow: from the breast down the middle and the sides deep crimson: vent barred black and white: lower part of the back and rump white: wings and tail black: some of the secondaries tipped with white at the very tip.

FEMALE.

The female, or what I suppose to be such, answers in every respect to the foregoing description, except in the head, which is wholly black, having only a line of white over each eye.

PLACE

The former of these is in the collection of Capt. Davies, the last in my possession; both of them from Cayenne.

Buffon does not tell us on what part of the head the red spot is in his bird; nor does he mention the lower part of the back and rump being white; but in the Planches enluminées it seems to be on the crown: and the lower part of the back and rump are there white, though omitted in the description: I will therefore suppose them trisling varieties.

€. ÷ RED-HEADED W.

HIS bird is eight inches and three quarters in length, and weighs two ounces. Bill an inch and a quarter long, of a lead-colour, with a black tip: irides dufky: the head and the whole of the neck are of a most beautiful crimson: back and wings black: the rump, breast, and belly, white: the ten first quills are black, the eleventh black and white, and the others white with black shafts: the tail black and cuneiform: legs and claws lead-colour. The cock and ben nearly alike.

Lev. Muf.

DESCRIPTION.

Inhabits Virginia, Carolina, Canada, and most of the parts of North America; but at the approach of winter migrates more or less to the southward, according to the severity of the season; and upon this circumstance the people of North America foretell the rigour or elemency of the ensuing winter.

PLACES.

Kalm observes that it is a very common bird, and is very defiructive to the maize-fields and orchards, pecking through the ears of maize, and destroying great quantities of apples. In some years they are more numerous than in others, when they attack the orchards where the sweet apples grow, which they eat so far that nothing remains but the mere peels. Some years since there was a premium of two pence per head paid from the public fund, in order to extirpate this pernicious bird; but this has been neglected much of late. They are said likewise to be very fond

MANNERS.

In Virginia and Carolina they stay the whole year, but are not feen in fuch numbers as in fummer. During the winter they are very tame; and are frequently known to come into the houses, in the same manner as the Redbreast is wont to do in-England.

It is observed that this species is found chiefly in old trees; and the noise they make with their bills may be heard above a mile distant. It builds the earliest of all the Woodpeckers, and generally pretty high from the ground. It is accounted by many people very good eating.

Buffon* is of the opinion that it is necessity alone that causes these birds to feed on the vegetables of any kind, as it is contrary to the nature of the genus.

BREASTED

DESCRIPTION.

COMEWHAT less than the last. The bill is an inch long, and of a brownish horn-colour: the head, neck, and breast, crimfon: from each nostril is a line of buff, passing under the eye, where it finishes: the back part of the neck mixed with dusky: back and wings black: feveral of the leffer wing coverts, near the outfide of the wing, are tipped with white, and others of the greater coverts have the outer webs white, making a streak of this colour parallel to and near the edge of the wing: most of the scapulars marked with an obscure yellowish spot at the tip: the first quill feather black, marked on the inner web half way from the base with round spots of white; the others spotted on both webs with white; the secondaries spotted on the inner web only: under wing coverts black and white mixed: the middle of the belly

dusky yellowish white: the sides of this last colour, mixed with dusky: the tail and legs were wanting.

This specimen came from Cayenne, and is in the collection of -Capt. Davies.

PLACE.

WHITE-RUMPED

DESCRIPTION.

CIZE of the greater spotted Woodpecker: length nine inches. Bill an inch and a quarter, and of an horn-colour: the head, throat, and all the upper parts of the body, are dusky; the feathers transversely streaked and waved with dirty white: the chin the same, but paler: the leffer wing coverts are like the back, but the greater ones plain black: the greater quills are dusky black; the outer edges fringed with cream-colour, and the tips of feveral whitish: the fecondaries white, except at the ends, where there are two irregular bars of black on each feather; but these are not the same in all, as on some of the inner-ones the second bar is wanting on the outer webs: the rump, belly, upper and under tail coverts, are white: the legs are black.

This is in the collection of Capt. Davies, who received it from Long Island. It has, till now, never come under my inspection. I have some opinion of it being a female, but of what species cannot ascertain; am therefore constrained to place it as a distinct species, at least for the present.

PLACE.

Br. Muf.

T ENGTH eight inches. Bill one inch, and of a yellow horn-

DESCRIPTION.

BELLIED

colour: crown and nape crimfon: between the bill and eye red; just round the eye white: sides of the head striated black

4 C 2

and

and white: from the lower jaw springs a crimson band, like a whisker: back, wings, and tail, brown black, without spots; but the ends of the last are just tipped with white: belly striated black and white: legs black.

This described from a specimen in the British Museum.

+ GREATER SPOTTED W.

DESCRIPTION.

HIS species is about the size of a Blackbird: in length nine inches and a quarter: weight two ounces and three quarters. The bill is thirteen lines long, blackish, with the base horn-coloured: the irides are reddish: general colour of the body black above: the forehead is of a dirty buff-colour: on the hind head is a bar of crimson: cheeks white: on each side of the neck, at the hind part, is a spot of white: the scapulars and wing coverts nearest to them are white, and the quills spotted with white also: the throat and breast are of a yellowish grey: the lower part of the belly and vent crimson: tail black; the four middle seathers plain; the others more or less marked with white; the outmost feather has two black spots on each side of

the

the web; the next has two on the inner, and one only on the outer web: legs lead-colour.

The female differs only in wanting the red on the hind head.

This bird is pretty common in England, France, Germany, and other parts of Europe, frequenting the woods like the rest of its genus, and is likewise met with in America. It is a very cunning bird; for when a person has seen one on a tree, he is almost sure to lose sight of it, if the tree is large, and the observer not very attentive; for the moment it spies any one, it will creep behind a branch, and there lay secure till the danger is over. The extreme facility with which birds of the Woodpecker kind descend as well as ascend the trees, is worthy admiration, seeming to do both with equal éase to itself. I do not find any one who has noticed the colour of the eggs*, but Busson † mentions having sound a nest with six young ones in an old decayed asp-tree, thirty seet from the ground.

FEMALE.

Middle spotted Woodpecker, Br. Zool. Nº 86. pl. 37.

+ MIDDLE SPOTTED W.

THIS is fomewhat less than the last, being in length only eight inches and a half; but in general markings it is much the same, especially on the back and wings. It differs chiefly in having the whole top of the head crimson, and round the eyes

DESCRIPTION.

^{*} Willughby observes, that the eggs of all Woodpeckers are white, as far as has come to his knowledge.

[†] Hift. des oif. vii. p. 61.

and fides of the neck almost wholly white: it has a streak from the under jaw passing backwards, like the last, but it is scarcely perceivable in a specimen now before me.

Brisson quotes many authors who have described this bird, but I am not clear in its being a distinct species; it is certainly much more scarce in England than any other. Busson is reconciled to its being a variety only; but if so, this variety is regular, at least in all the specimens which I have seen.

←·LESSER SPOT'ΓED W. Description.

THIS is certainly the least of the European species, but not of the genus, as will be hereaster mentioned. The length is only five inches and a half: weight scarce one ounce. The bill is lead-colour: irides red: the upper parts of the body black, striated across the back-with-white: scapulars and quills spotted black and white: forehead dirty pale buff: the crown of the head crimson: cheeks and sides of the neck white: the under parts of the body dirty white: the four middle tail seathers are black; the others black and white: legs lead-colour.

FEMALE.

The female has the top of the head white, which is red in the male; but neither have the vent red, as in the two last species.

Scopoli

Scopoli observes, that the shins are plumose at the base.

Salerne * fays, this bird is not found in France; but Buffon affirms, that it inhabits most of the provinces there.—The first Gentleman says likewise, that Frisch does not mention it; but this is not fact; he indeed says, it is rare, but gives two excellent figures of it †.

It approaches near habitations in winter, and may be seen in the orchards adjoining, which, no doubt, it does for the sake of food; finding about the trunks of the trees both *Caterpillars* and *Larves* of insects of all kinds. It builds in an hole of a tree, and often disputes the right of possession with the little Colemouse; which last, as it is much weaker of the two, must yield the victory.—Willughby ‡says, it is called in England by the name of Hickwall.

Linneus, in his fynonyms of this bird, quotes Haffelquist | for the fame; but whoever will diligently read what this author fays of the matter, will be convinced, that the reference should be to the greater rather than the least of this genus.—It is faid by him to inhabit the higher parts of Asia.

Mr. Sonnerat § mentions a bird found by him at Antigue, in the island of Panay, with the top of the head, and hind part of

PLACE.

A VARIETY.

* Orn. p. 107. + Pl. 37. † Orn. p. 138.

Il Hasselquist says, that it is the fize of a Fieldfare; that the crown of the female is black; whereas in this species it is white.—He says, too, that the vent feathers are red in both sexes; but in this they are so in neither: that the breast, in the male, is pale ferruginous, with long lines of black; in the female, plain; and the rump rose-coloured in both sexes; and that there is a black line from the bill, passing under the eyes, to the hind head. All these circumstances convince me, that it is the greater species, or at least a variety of it, and by no means the bird-last treated of above.—See Hasselq, Itin. p. 342. No 21.

& Petit Pic d'Antigue, Son. Voy. p. 118. pl. 77.

the neck, of a greyish black: on each side of the neck, two-thirds downwards, is a stripe of white, which begins just above the eye; and under this another of black from the eye to the shoulder: upper part of the body black and white: under parts pale yellow, spotted with black: tail black above, beneath barred with a dirty white and yellowish colour: bill and legs blackish. The head had no red on it.

Buffon supposes it to have been a female, and a variety only of our least spotted Woodpecker.

L'Epeiche du Mexique, Bus. ois. vii. p. 70.

Quauhchochopitli, seu Avicula Ligna excavans, Fern. H. N. Hisp. ch. 94.

DESCRIPTION.

HIS is of the fize of the middle spotted Woodpecker: the whole body covered with black feathers, transversely striated with white: breast and belly red: quills and tail black, transversely striated with white.

PLACE AND REMARKS.

Inhabits the colder parts of Mexico. Buffon thinks this bird and the greater one of Briffon, N° 21, to be the same bird. Ray, copying Fernandez, says, it is as big as a Quail; if so, it will not differ much in size from the other, which Briffon says is equal to the green Woodpecker. But Klein would almost persuade us, that this last is not a Woodpecker, when he talks of its darting down on fish into the water, which we know to be rather the characteristic of the Kingfisher than any other; and, if I may be allowed the supposition, it is not unlikely to suppose, that he means

the Alcedo Alcyon, which acts in this manner. Inhabits Mexico, as well as other parts of America; and answers to his colour very nearly *.

CANADIAN SPOTTED W.

fifteen lines long, and of a horn-colour: upper parts of the body black, with a mixture of white in the middle of the back: under parts whitish: head black: forehead dirty white: on each side is a broad white band, passing above the eyes, and joining a pale orange one on the hind head: under the eye is another white band, which widens as it proceeds downwards on the sides of the neck: wing coverts and quills spotted with white: the two middle tail feathers are black; the next has a dirty white spot near the tip; and the three outer ones have the ends marked obliquely with white; the two outmost ones being wholly whites except at the base: legs grey brown.

Description.

^{*} The upper parts are dark ash: quills spotted white; belly white, with the middle rusous in one sex; and is white both before and behind the eye besides. Klein names it Jaculator cinereus. See Klein av. 127. No 2.

570

PLACE.

Inhabits Canada. Buffon supposes it to be the Quauhtotopotli of Fernandez*, above quoted.

FEMALE.

That in Pl. enl. must mean the female, as it has no orange on the hind head; nor is the front of a dirty white.

Red-bellied Woodpecker, Catefb. Car. i. pl. 19. f. 2.—Am. Zool. N°

DESCRIPTION.

HIS is bigger than our greater spotted Woodpecker: length ten inches and a half. The bill is black, and an inch and a half in length: irides hazel: the crown of the head, and upper part of the neck behind, are bright red: the cheeks yellowish white: the upper parts of the body black, marked with transverse narrow whitish lines: throat and fore part of the neck, as far as the breast, dirty olive; becoming red by degrees, as it approaches the belly: the lower parts of the belly and thighs are marked with transverse brown lines: the tail is black: the outmost feather dotted with white on the outer edge: legs and claws black.

* Fernandez fays, it is tamed and kept in houses: of the fize of a Starling: that it is black, spotted with white: that it makes holes in trees, and feeds in the same manner as other Woodpeckers; but does not mention that it has red on any part of the body.

The

The female differs in having that part of the head rufous white, which is red in the male.

Inhabits Carolina and Jamaica.

FEMALE.

PLACE.

TO VAR. A.

DESCRIPTIONS

HAVE had feveral from the last-mentioned place, which differed a little; for the forehead was pale buff, in both sexes, as well as the cheeks: the belly had a pale yellowish-brown tinge, but not at all inclined to red: the two middle tail feathers were transversely barred with white on each side; the next only on the outer web, but both home to the shaft; and the outer feather dotted with white, on the outer margin, the whole length; but on the inner one only near the end: the head, and other particulars, answering to Brisson's description.

Kalm observes, that the colour of the head is deeper, and of a more shining red than Catesby has represented it.

Sloane fays, this bird is met with every where in the woods; and loves the Capficum, or Indian pepper, very much.

L' Epeiche ou Pic rayé de la Louisiane, Buf. ois. vii. p. 73.

————, Pl. enl. 692. female?

VAR. B.

DESCRIPTION.

A LITTLE bigger than the greater spotted Woodpecker. Upper part of the head pale red: on the throat, and under the eyes, some markings of the same: general colour of the plumage above black, transversely striped with white; beneath greyish white: the two middle tail feathers, and the two outer tail feathers, black and white mixed; the others plablack.

One of these, supposed to be the female, had a grey forehead, and no red on the head, except at the back part.

FEMALE.

Lew. Mus.

DESCRIPTION.

IT is a trifle less than our spotted Woodpecker: weighs two ounces: and is in length eight inches and three quarters. The bill is an inch and a quarter long, and of a horn-colour: the head is black; on each side are two white lines, the one passing above the eye, and the other along the lower jaw; both arising from the base of the bill: across the hind head is a red band: the upper parts of the body are black; which colour is as it were divided by a list of white feathers, like hairs, passing down the back: the wings are spotted with white: the under parts of the body wholly white: the four middle tail feathers are black; the next on each side obliquely white at the tip; the last but one white, with the base black; and the outer one wholly white: the legs and claws are grey-brown.

FEMALE. PLACES. The female differs only in wanting the red on the hind head.

Inhabits Carolina, Virginia, and Canada. Kalm fays, he found it in great plenty; and that it destroys the apple-trees by pecking holes in them.

Hicus pubefcens, Lin. Syft: i. p. 175: No 15. Le petit Pic varié de Virginie, Bris. orn. iv. p. 50. Nº 18. L'Epeiche, ou petit Pic varié de Virginie, Buf. oif. vii. p. 76. Smallest Woodpecker, Catesb. Car. i. pl. 21. Least spotted Woodpecker, Kalm. Tr. ii. p. 87. Little Woodpecker, Am. Zool. No.

Lev. Mus.

THIS is so like the last species as to be almost taken for it, were it not confiderably less in fize, weighing, according to Catefby, only fourteen pennyweights*; but Brisson describes it as fomewhat bigger than our European smallest species: the length is five inches and a half. The bill is eight lines long, and of a horn-colour: top of the head black; on each fide above the eye is a white line: hind head red: hind part of the neck, the back, and rump, are black; which is, like the last, divided into twoparts by a line of white, passing down the middle to the rump: the fcapulars, and upper wing and tail coverts, are black; the greaterwing coverts and quills spotted with white: the under parts of the body pale grey: tail black; the four middle feathers plain; the rest barred with white and black: legs and claws black.

DESCRIPTION.

The female has no red on the hind head. Linnaus observes that the outer tail feather is white, marked with four black. foots.

This species inhabits Virginia and Carolina.

According to Kalm, this species abounds in New Jersey, where it is accounted of all others the most dangerous to orchards, and is the most daring. As foon as it has pecked one hole in a tree,

REMARE.

PLACES.

An ounce and a half. Hift, des oif.

it makes another close to the first, in an horizontal direction; proceeding till it has made a circle of holes quite round the tree; and the apple-trees in the orchards have often several of these rings of holes round the stem, insomuch that the tree frequently dries up and decays.

YELLOW-BELLIED W. DESCRIPTION.

HIS is in length feven inches and a half. Bill eleven lines long, and of a lead-colour: crown of the head red, bordered on each fide with black: hind head pale yellow, which paffes on each fide over the eyes, forming a band of the fame colour: from the base of the bill, through the eyes, to the hind head, is a band of black; beneath this is another of a pale yellow, which arifes at the nostrils, and goes downwards towards the neck; and again, under this is another black one, which originates at the base of the under mandible, parallel to the jaw, after which it bends towards the fore part of the neck, blending itself with the black on the fore part of the neck: the throat is red: the fore part of the neck and breast black, bordered with yellow: the belly of a light yellow, mixed with a little black: fides, thighs, and under tail coverts, white, transversely banded with brown: the upper parts of the body are black and white, mixed; not very different from the greater spotted Woodpecker, but more white: the two middle tail feathers are black, marked on both fides the shaft

shaft with white; the two next on each fide plain black; and the outer ones black on the outer web, and spotted with white on the inner at the tip: legs and claws blackish.

The female differs in having no red about her *, and the throat and hind head white, as well as the stripes on the sides of the head, which are yellow in the male.

This species inhabits *Virginia*, *Carolina*, and *Cayenne*. *Kalm* gives this as bad a character as the two last, in respect to the damage it does to the apple-trees.

FRMALE.

PLACES.

ENCENADA

DESCRIPTION-

THIS is a trifle bigger than our least spotted Woodpecker; and, according to Buffon, is one of the most beautiful of its race: the length in the plate is about six inches. The bill is of a lead-colour: the irides white: the plumage in general consists only of two colours, grey-brown and white; but these are irregularly blended together, so as to render it extremely beautiful; above, these colours are mixed transversely, and beneath, in a perpendicular direction: the head is crested, and mixed on the sides with crimson: sides of the head white, verging to brown under the eye: the quills are brown, dotted with white: legs lead-coloured.

The head of the female is wholly brown, and it is destitute of a crest.

FEMARES.

^{*} So Catefby fays; but Linnæus remarks, that the female has the crown red; which is in the right I cannot determine, not having feen it.

CARDINAL W. Le Pic Cardinal de l'Isle de Luçon, Son. Voy. p. 72. pl. 35. Le grand Pic varié de l'Isle de Luçon, Buf. ois. vii. p. 67.

DESCRIPTION.

SIZE of our green Woodpecker. Bill blackish; the seathers round the base of the upper mandible are grey, with a cast of green: the crown and hind head are of a bright red: on each side from the eye behind, and down the neck, almost to the wing, is a stripe of white: the back and wing coverts are black, but the seathers on the lower part of the neck, and upper part of the back, are margined with white, and the wings are spotted with the same: the quills and tail are black, with yellow shafts; the greater quills are spotted on the edges with yellow, and the lesser ones transversely barred with white: the throat, breast, and belly, are white, marked with longitudinal black spots: the legs are blackish: the tail seems spotted in the plate, but is not mentioned in the description.

PLACE.

Inhabits the ifle of Luzonia.

NUBIAN W. L'Epeiche de Nubie ondé & tacheté, Buf. ois. vii. p. 66. Pic tacheté de Nubie, Pl. eul. 667.

Description.

HIS is one-third less than the greater spotted Woodpecker: length seven inches and a half. The bill is black: irides pale brown: the crown is black, dotted with white: the forehead brownish: from that to the eye whitish: chin the same: the hind head crimson, and somewhat crested: the rest of the neck and breast whitish, marked with black spots, shaped like tears: the upper parts of the body most agreeably and irregularly mixed

with white, rufous, and brown: tail barred rufous and brown: the thighs and vent are whitish: legs blue.

I suppose, from the name, it is a native of the deserts of Nubia, though Buffon does not say as much, only that it is a new species.

Green Woodpecker, Albin. i. pl. 18.—Br. Zool. No 84.—Amer. Zool. No Br. Muf. Lev. Muf.

THIS is a large species, being in length thirteen inches: it weighs six ounces and a half. The bill is two inches in length, dusky, and of a triangular shape: the irides of two colours; the inner circle reddish, the outer white: the crown of

DESCRIPTION .

4 E

the

the head is crimfon, fpotted with brown black: fides of the head blackish: on the lower jaw a spot of red: the upper parts of the body are of an olive green, towards the rump greatly verging to yellow: quills dusky, spotted with whitish; the under parts greenish white, or very pale green: tail barred, dusky and greenish: all except the outer ones black at the end: legs greenish ash.

FEMALE.

The female differs from the male in wanting the red mark on the lower jaw. Willughby * fays, it lays five or fix eggs; which Pennant † observes also, and says, that they are of a beautiful semi-transparent white.

These birds sometimes build in a hollow asp, or other tree, fifteen or twenty feet from the ground. The male and female take it by turns to bore through the living part of the wood, till they come to the rotten part, wherein, after being hollowed out to a proper depth, they lay their eggs ‡, which are generally five, and sometimes six || in number, greenish, with small black spots. The young ones climb up and down the trees before they can sly. It is worthy remark, to observe with what nicety the holes of the Woodpecker are made, as perfectly round as if made by the assistance of a pair of compasses. Nuthatches, Starlings, and Bats, frequently build in these holes when deserted.

^{*} Orn. p. 136.

[†] Br. Zool. p. 242. where some pertinent observations on these birds may be found. Let the reader also consult Ray on the Creation, p. 143. and Derham's Physico-theol. p. 193, 339, 342.

[†] This is sometimes so deep that they must feed their young quite in the dark; for I have been told by one, that he was obliged to thrust his whole arm to the shoulder down the hollow of a tree, before he could reach the eggs.

^{| &}quot; I have seen six young ones together in one nest." Will. orn. p. 136.

Both Frisch and Klein mistake in saying that the females have not the red crown, for even the young ones in the nest have the appearance of it; and I have had them brought to me when they could scarcely sly, when the red was mixed with brown; but they do not become of a full red till after the first moult. They are said to be fond of bees in winter, making great havock among them. Salerne * observes, that they are sound in the markets in Italy, at Bologna; but this is not extraordinary, for the Italians eat all small birds almost without exception.

In Sir A. Lever's Museum there is a variety of this bird, of a straw-colour throughout, except the crown, which is faintly marked with red.

VARIETY.

Pic verd, Ferm. Descr. de Surin. vol. ii. p. 169. Le Pic verd du Mexique, Bris. orn. iv. p. 16. N° 3?

25. VAR. A.

THE description of this given by Fermin so exactly coincides with that of the last, that we must conclude it to be the same; if so, we cannot deny the possibility of its being at Mexico, as related by Seba +: indeed the toes are not placed after the manner of Woodpeckers in his figure, but three and one; a mistake committed by later authors as well as him; for I must own that his description suits the green Woodpecker rather than any other bird; and the length, which is thirteen inches and a half, very nearly corresponds with it. Buffon will not allow of Seba's bird belonging to this genus; nor does he suggest to which other it has most affinity. I have given my suggestion of one in page 557,

DESCRIPTION.

Buf. ois. vii. p. 23.—Pl. enl. 695.

Woodpecker from Bengal, Albin. iii. pl. 22.

Spotted Indian Woodpecker, Edw. iv. pl. 182.

Description.

HIS is less than our green Woodpecker: length eight inches and a half. The bill is an inch and a half long, and blackish: top of the head black, spotted with white: the hind head furnished with a crimson crest, and pretty long: hind part of the neck black: throat and fore part of the neck black and white, irregularly mixed: breast, upper part of the belly, and sides, white; the feathers margined with brown: lower belly, thighs, and vent, white: sides of the head under the eye white; from this a white line passes down the neck: the upper part of the back is yellow; the lower of a dull green: the under wing coverts, and the upper lesser wing coverts, are deep brown, spotted with white; the rest of the wing green, spotted with lighter green: quills black, barred with white: tail greenish black: legs and claws blackish.

PLACE.

Inhabits Bengal, and is a most beautiful species.

26. Var. A. Description. Specht de Ceylon, Naturforscher, pt. 13. pl. 1.

HIS is longer by an inch than the last. The bill is an inch and sour lines in length, of a lead-colour, palish at the base:

it

it differs from the last bird in having the white spots on the head more numerous: and the upper part of the back is black where the other is yellowish: the middle of the back, and that part of the wings which in the other is brown, is in this of as fine a red as the crest itself: throat and breast brown, irregularly spotted with white: the greater quills brown, dotted with white: the tail brown.

This came from Ceylon*, where it is called Kerella. It is faid to make its nest there in old trees, and feed on insects. This is most probably only differing in fex from the other.

PLACE-

Pic grivelé; ou grand Pic de l'Islè de Luçon, Son. Voy. 73. pl. 37. Palalaca, ou Pic vert tacheté des Philippines, Buf. oif. vii. p. 21. Pic verd des Philippines, Pl. enl. 691.

25.. Var. B.

SIZE of the common green Woodpecker. Bill black: irides red: the top, fides, and hind part of the head and neck, back and wings, are of a shining brown, with a mixture of green: the feathers on the top of the head are longer than the rest, forming a crest: the throat, fore part of the neck, breast, and belly, white; each feather margined with black, making the bird appear to be spotted with white and black: the tail is black brown; on each web is a white spot, forming, when the tail is expanded, a white band: the upper tail coverts of a carmine red: legs black.

Description.

Inhabits

^{*} Perhaps too from China, as I fee it among some drawings belonging to the late Dr. Fothergill, which were done in China; but the toes were placed three and one.

582 -

PLACE.

Inhabits the isle of Luzonia, where it is called by the natives Palalaca.

Buffon mentions a greater fort *, which is faid to be as big as a Fowl, with a red crefted head, and a green body. This is called also Palalaca by the natives. The Spaniards call it Herrero, or Blacksmith, on account of the great noise it makes with the bill in striking the trees, which, according to Camel †, may be heard at three hundred paces distance.

GOA W. Le Pic vert de Goa, Buf. ois. vii. p. 22.

DESCRIPTION.

THE fize of this is less than the common green Woodpecker. The bill is black: crown and hind head crimson, the last crested: this last is bordered at the temples with a white stripe, which widens as it passes behind to the neck: from the eye springs a black band, which, passing downwards in a zigzag manner, falls over the wing, the lesser coverts of which are also black; the rest of the wing is of a golden yellow, which ends in a greenish yellow on the lesser quills; the greater ones are variegated black and white: the tail is black: beneath the body is whitish; the feathers edged with black: legs lead-colour.

PLACE.

This came from Goa, and feems much allied to the last but one, if not the same. It differs indeed in having the whole crown red; whereas, in the last mentioned, the front is black, spotted with white, and the throat is also of this last colour.

^{*} Palalaca, ou grand Pic vert des Philippines, Buf. oif. vol. vii. p. 20. † Phil. Trans. N° 285.

Inhabits the Cape of Good Hope.

HALF-BILLED W. Picus semirostris, Lin. Syst. i. p. 175. No 14. Picus maxilla superiore breviore, Mus. Adolph. Fred. i. p. 16.*

DESCRIPTION.

KNOW of no one who has described this bird, independent of the singularity of the bill, except Linnæus. It is of the size of a black Woodpecker. The bill is pale; the lower mandible much as in others of the genus, but the upper one much shorter,

very

very pointed, thin, and sharp at the tip: the head is brown, each feather tipped with yellowish; making the head appear spotted: the body on the upper parts is brown, inclining to ash; beneath white: the wings are brown: the outer edges of the quills spotted with white: tail brown *.

Inhabits India.

PLACE.

RAYED

HIS is a little bigger than the greater spotted Woodpecker: the length is eight inches and three quarters. Bill horn-colour: the forehead, cheeks, and throat, are of an elegant grey: the crown and hind head red: the upper parts of the body black, transversely striated with olive: quills blackish, spotted with yellow on the outer, and with whitish on the inner web: rump and upper tail coverts red: fore part of the neck, breast, and under wing coverts, grey brown: belly, sides, thighs, and under tail coverts, olive:

DESCRIPTION.

* Pallas + has mentioned his opinion concerning this bird, which, as far as relates to the bill, he thinks must be a Lusus Naturæ, and therefore unnatural; and instances a specimen of the common green Woodpecker, lately met with in Germany, wherein the upper mandible was scarce half as long as the under one. He gives also two instances of the same in the Kingssisher genus, and one in the Oyster-catcher. To which I may add the very same circumstance in a white Crow in the Leverian Museum, whose upper mandible is just formed in the same manner. Notwithstanding all this, we are still indebted to Linnæus for a new species, not before described, nor sigured by any author, as far as I can learn.

† Spicileg. 6. p. 12.

tail black; the two outer feathers edged with grey; beneath olive: legs and claws blackish.

PLACE.

Pl. enl. 509.

Charpentier jaune, Ferm. Descr. de Surin. vol. ii. p. 171?

Lew. Mus.

YELLOW W.

HIS is less than our green Woodpecker: being only nine inches in length. The bill is of a yellowish white, and above an inch long: the hind head is crested: the head itself, the neck, and whole body, covered with dirty white feathers: from the lower jaw to the ears, on each side, is a red stripe: the wing coverts are brown, edged with yellowish; and some of the greater ones mixed with rusous on the inner web: quills brown or rusous: tail black: legs and claws grey.

Description.

This is common at Cayenne, and is called there Charpentier jaune. It makes the nest in old trees which are rotten within; making with its bill a hole from without, at first horizontal, but declining downwards as soon as it has pierced through the sound part, till it is at last a foot and a half below the first opening. The female lays three white and nearly round eggs, and the young are hatched about the beginning of April. The male bears his share in the work with the female, and in her absence keeps centinel at the entrance of the hole. The note of this bird is a kind of whistle six times, repeated, of which the two or three last are in a graver accent than the others. The female wants the red band on the side of the head, which is seen in the male.

PLACE AND MANNERS.

REMALE.

Specimens vary; some are of that dirty white, as Brisson describes it, others of a light yellow; which last is the case in a specimen.

specimen in the Leverian Museum: this is thirteen inches in length.

In the place referred to above, we find a bird imperfectly described by Mr. Fermin: he merely says, that it is a large species: that it has a fine red crest on the head: the neck, breast, and belly, of a citron-colour: and the wings blueish above. He only adds, that it may be distinguished from others by the strokes of the bill, which it gives to the trees, and may be heard at a great distance.

FERRUGINOUS W. Le Pic mordoré, Buf. ois. vii. p. 34.

Pic jaune tacheté de Cayenne, Pl. enl. 524. the male.

Ferruginous Woodpecker, Amer. Zool. No

Lev. Mus. the female.

Description:

SIZE of the green Woodpecker: length eleven inches. Bill black: head crefted: the creft of a dark yellowish cream-colour: the upper parts of the body of a reddish cinnamon-colour, marked sparingly with yellowish white spots: on each side of the throat a large spot of crimson: the lower part of the back yellowish ash-colour: the tail and legs black.

Buffon's bird was of a brighter colour: he calls his colour, on the upper parts, a bright, brilliant, gilded red*; and fays, that the creft is yellow: the rump was likewife yellow in his bird. My description is taken from one in the collection of Capt. Davies.

The

^{* &}quot;Un beau rouge wif, brillant & doré." This is no doubt his mordoré colour; but in all the specimens which I have seen, it has been more of a rust-colour, or cinnamon.

The female is faid to want the red on the fide of the jaw, which circumstance inclines me to think, that the specimen alluded to, in the Leverian Museum, was of this sex. The bill in this was pale, being black only at the base: crest bust-colour: rump, lower part of the belly, sides, and thighs, dirty yellow: vent pale rust-colour: inside of the quills marked with both dark and pale spots: quills and tail dusky: the rest of the plumage as in the male.

These inhabit Cayenne, Guiana*, and other parts of America.

Praces.

FEMALE.

Le Pic à cravate noire, Buf. ois. vii. p. 35. Pic à cravate noire de Cayenne, Pl. enl. 863.

BLACK-BREASTED W.

of the last. The bill is pale: head, throat, and hind part of the neck, orange yellow: the lower part of the last behind, and the fore part of the neck and breast, are black: the head is crested: back and wings bright rusous; on the last are here and there some spots of black; as also on the tail, the end of which is black: the quills are marked with black: the belly and vent are of a pale ferruginous buff: and the legs lead-colour. Buffon says, the tail in the Pl. enl. is made too short.

Description.

This species inhabits Cayenne and Guiana; the natives of the last call it Toucoumari. The three last are much allied to each other; and our author supposes them the same which are found at St. Domingo, since P. Charlevoix says, that on looking out for

PLACES.

Petit Pic de Cayenne, Pl. enl. 786. 1.

Ferm. Descr. de Surin. vol. ii. p. 170.

Lev. Mus.

DESCRIPTION.

SIZE of a Wren: in length three inches and a half. The bill is black: top of the head red: the hind head black, dotted with white: fides of the head brown, dotted with white also: the upper parts of the body are dirty greyish rusous: the under parts are greyish white; the feathers bordered with brown: quills and tail brown, with paler edges: legs brown.

Brisson says, the four middle tail feathers are brown; the next on each side the same on the outside, but rusous white on the inner web, margined with brown; and the two outer ones half brown, half rusous white, tipped with brown.

Fermin tells us, that the head and hind part of the neck are of a cinnabar colour, the tail black, and the feathers which cover the wings fprinkled towards the end with yellowish white.

These different accounts incline one to think, that they must have been described from opposite sexes.

PLACE.

Inhabits Cayenne.

Picus

+ GOLD-WINGED W.

HIS is a trifle less than our green Woodpecker: in length it is eleven inches: weight five ounces. The bill is an inch and a half in length, black, and fomewhat bent; and, contrary to others of the genus, is rounding, and not fquare; ridged only on the top, and the point is sharp: the upper parts of the head and neck are ash-coloured: hind head red: sides of the head, throat, and fore part of the neck, pale yellow: on each fide of the head is a stripe of black, from the base of the lower jaw to the neck : back, fcapulars, and wing coverts, grey brown, transversely striated with black lines: rump whitish: breast, belly, and sides, whitish yellow, each feather marked with a round black spot at the tip: on the middle of the breast is a large crescent of black: the thighs, and upper and under tail coverts, black and white mixed: quills brown, with yellow shafts spotted with brown on the outer edge: tail blackish, outwardly edged with grey; the outer feather is dotted with whitish on the margins; the shafts of all but the two middle feathers are yellow half way from the base: legs and claws brown.

DESCRIPTIONS

The female differs in having the crown and neck behind grey brown: the hind head of a less vivid red: and the greater quills

FEMALE.

not spotted on the edges. She also wants the black list on the throat, but otherwise like the male.

PLACES AND MANNERS. Inhabits Virginia, Carolina, and Canada, and is plenty in New Jersey, and about New York, where it is called by some Hittock, or Pint, and by others High-hole. Both the first names have some relation to its note; and perhaps the latter, from the situation of the nest. It is almost continually on the ground, and is not observed to climb on the trees, like others of the genus. It lives chiefly on insects *, and is commonly very fat, so as to be thought very palatable for the table. It stays all the year; and, as it cannot at all times get insects, it must, perhaps, eat some kind of grass or plants in the fields. Its form, and some of its qualities, make it resemble the Cuckow †. It seldom climbs up the trees, but only sits occasionally on the branches.

Forster, in the Philosophical Transactions above quoted, observes, that it is a bird of passage in the northern parts of America, visiting the neighbourhood of Albany Fort in April, and leaving it in September; that it lays from four to six eggs, in hollow trees, and feeds on worms, and other insects. Called by the natives Outher-quan now.

In defect of infects, I have been informed, that it feeds on the berries of the red cedar, and grows fat on them. This food has been both difgorged by the mouth, after being shot, as well as found in the stomach on diffection.

⁺ Linnaus, in his tenth edition of the Syst. Nat. had ranked this with the Cuckows; and Buffon, from its similarity to this genus, has placed it at the end of the Woodpeckers of its class.

WOODPECKER.

FEMALE.

The female has no red on the head, nor any mark of white on the back and rump.

PLACES.

This is *Brisson*'s description, who informs us, that it came from *Cayenne*; but adds, that it is likewise found in *North America* and *Europe*: likening that of *Edwards* to his bird; which, however, differs in some particulars.

Buffon scarce seems reconciled to a three-toed Woodpecker being found in South America; however, we are assured by Bancroft that such an one is met with there, and he describes it particularly. His bird was the size of the European one: the colour black and white mixed: the top of the head, and under the belly, bright crimson. The bird sigured in the Planches enluminées has four toes, placed two and two; and has two streaks on each side of the head, one behind, and the other beneath the eye; otherwise not greatly unlike Brisson's bird. The whole seems to want surther illustration. I have as yet seen only such specimens as inhabit the northern parts.

GENUS XXII. JACAMAR.

N° 1. Green Jacamar. N° 2. Great J. Var. A. Long-tailed D°. 3. Paradife J.

BILL long, strait, sharp-pointed, quadrangular.
Nostrils oval, placed near the base of the bill.

Tongue fhort, pointed.

Legs feathered before, as far as the toes.

The toes placed two before and two behind.

This genus is much allied to the Kingsfisher, but the toes are differently placed. The food of the Jacamar is likewise different, as it seeds on insects alone, and frequents moist woods; while the Kingsfisher tribe inhabits streams of water for the most part, and has a peculiar address in fishing for the young fry of fish, on which it feeds. We are not perfectly acquainted with the manners and economy of the genus here treated of; and in respect to the nest and eggs, nothing whatever is known about them.

I believe there are not more than three species yet known.

Br. Mus. Lev. Mus.

HIS beautiful bird is nearly of the fize of a Lark, and meafures in length eight inches and three quarters. The bill is 4 H 2 black, GREEN JACAMAR.

Description.

black, two inches in length, of a square form, a trifle incurvated, and sharp at the point: irides blue: the plumage in general, on the upper part of the body, is of a most brilliant green, glossed with copper and gold in different lights: the chin white: the belly, throat, and vent, rusous: the tail composed of ten feathers, and cuneiform in shape; the two middle ones are three inches and a quarter long; the outer ones very short: the legs are of a greenish yellow, very short and weak: claws black.

Some of these birds have the throat rusous, as well as the belly, and in others the chin is yellowish, instead of white.

PLACES AND MANNERS.

This species is found both in Guiana and Brasil, in the mossile woods, which it prefers to the more dry spots, for the sake of insects, on which it feeds. It is seldom seen except single, as it is a very solitary bird, keeping for the most part in the thickest parts; its slight quick, but short; perches on branches of a middling height, where it sits all night, and frequently part of the day, without stirring. Though these birds are solitary, yet they are far from scarce, as many may be met with.

They are faid to have a short and agreeable note *.

The natives of Guiana call this bird Venetore, and the Creoles, Colibri des grands bois. At Brafil their flesh is eaten by some. That figured in the Genera of Birds, seems a Variety; it has less green on the back, and the breast, belly, and part of the back, of a variable copper-colour.

Mr. Pennant fays, that his bird was of the fize of a Lark, otherwise one might have suspected it to be the next species.

* Hift. des eis.

Long tailed green Jacamar.

Lev. Muf.

LONG-TAILED GREEN DESCRIPTION.

IN the Lev. Mus. is a Jacamar which corresponds with the above, but the tail is much longer in proportion: the upper parts of the plumage are very brilliant: the ferruginous colour of the belly very clear: and the tail full five inches in length.

CIZE of the green Woodpecker; proportions of a Bee-eater. fquare; fides flat, not compressed: nostrils bare: head and limbs green-gold: rest of the body copper-gold: tail cuneiform, longer than the body: beneath from the throat to the tail dull ferruginous: the fore toes cloven.

DESCRIPTION.

GREAT

The above is described from Pallas*, who fays no more of it. He calls it a new Jacamaciri, but does not say from whence it came.

Alcedo paradisea, Lin. Syst. i. p. 181. No 14.

CIZE of a Lark: length eleven inches and an half. Bill almost two inches and a half long, black, much pointed at the end,

DESCRIPTION.

See Spic. 6. p. 10. note b.

and of a fquare shape, but somewhat compressed on the sides; the head is of a dull violet brown: throat, fore part of the neck, and under wing coverts, white: the rest of the plumage of a deep dull green, in some lights appearing almost black, in others with a slight gloss of violet and copper bronze: the tail is composed of twelve feathers of unequal lengths; the two middle ones are six inches long, and exceed the next by two inches and a quarter: the outer one is only an inch long: the legs are black: the toes placed two before and two behind *, and pretty much united.

FEMALE.

The female is faid to be like the male, but the tail is shorters and the colours more dull.

PLACE.

Inhabits Surinam.

This species, like the others, feeds on infects; and sometimes, contrary to them, frequents open places. It slies farther at a time, and perches on the tops of trees. Frequently sound in pairs, and is not quite so solitary a bird as the other. It also differs in the note, having a kind of soft whistle often repeated, but not heard a great way off.

GENUS

^{*} Edwards has drawn this bird with three toes before, and one behind, and in course makes it a Kingsfisher; to which it has resemblance.

** WITH THREE TOES.

36 Three-toed K.

HE characters of this genus are:
The bill long, strong, strait, sharp-pointed.
Nostrils small; and in many species hid in the feathers.

Tongue short, broad, sharp-pointed.

Legs short, three toes forward, and one backward *: three lower joints of the middle toe joined closely to those of the outmost.

Every part of the world is furnished with one or other of the Kingsfisher tribe; but it is believed that Europe possesses only a single species. Most of the genus frequent rivers, and live on fish, the singularity of catching which is admirable: sometimes hovering over the water, where a shoal of small sishes is seen playing near the surface; at other times waiting with attention, on some low branch, hanging over the water, for the approach of a single one, who is so unlucky as to swim that way; in either case dropping like a stone, or rather darting with rapidity on his prey, when, seizing it cross-ways in his bill, it retires to a resting-place, to feast on it; which it does piecemeal, bones and all, without reserve, afterwards bringing up the indigestible parts in pellets, like birds of prey.

The wings of most of the genus are very short, yet the birds fly rapidly, and with great strength.

^{*} One species excepted, which has but three toes in all.

KINGSFISHER.

It may be remarked, that throughout this genus, blue, in different shades, is the most predominant colour.

PLACE.

This species inhabits Africa. Dr. Pallas says, that he has seen many of them, all of which have been brought from the Cape of Good Hope.

VAR. A.

Martin pêcheur huppé, Buf. oif. vii. p. 188 .- Pl. enl. 679.

DESCRIPTION.

THIS, if not the very fame bird with the former, is not greatly different. The length of it is fixteen inches. The upper parts of the body blackish grey, spotted transversely with white: the breast, vent, and under tail coverts, rusous: the rest of the under parts white. This seems much to correspond with the former; but I am not so well satisfied about the next described, though it in some measure bears a resemblance.

BLACK AND - WHITE K.

Alcedo rudis, Lin. Syft. i. p. 181. N° 12. Le Martin pescheur blanc & noir, Bris. orn. iv. p. 520. N° 24. t. 39. f. 2. Le Martin pêcheur pie, Buf. ois. vii. p. 185. Martin pêcheur huppé du Cap de Bonne Esperance, Pl. enl. 716. Black and white Kingssisher, Edw. i. pl. 9.

DESCRIPTION.

ENGTH eleven inches. The bill black, and near three inches long: the head and hind part of the neck covered with black feathers, edged with white on each fide, fo as to form longish lines of this last colour: on each fide of the head is a stripe of white, beginning at the base of the upper mandible, and passing over the eye towards the neck: the back, wings, and upper parts of the body, are spotted irregularly with black and white: the breast and sides the same, but the black spots less: throat,

throat, and under parts to the tail, wholly white: quills spotted white and black; the tips of the greater ones black: tail white, with a black band near the end, which is narrowest on the more outward feathers; besides which, the two outward feathers have two femicircular black marks, one on each fide, near the margin: legs and claws black.

Inhabits Afia and Africa. Buffon received one from the Cape of Good Hope *, fimilar to the above, but fmaller, being only eight inches in length. The top of the head was black: the back was also black, clouded with white: the other parts of the body mixed black and white, not unlike the other, but on the whole had a much greater mixture of black in the plumage.

Edwards's bird is faid to have come from Persia; and Brisson fets down the Crab-catcher of Sloane + as fynonymous; but Buffon will not allow of it by any means, reasoning from the impossibility of any one species of these birds being a native of both continents. Whether this be the case or not, I am clear that neither Sloane's description nor figure will by any means ascertain the fact, the one being not fufficiently explicit, and the other most miserably executed.

PEACES.

Alcedo Ægyptia, Hasselq. Itin. p. 245. No 23.

THIS is the fize of the Royston Crow. The bill is blackish, more than half an inch broad at the base, and two inches in length: the head, shoulders, and back, are brown, marked with oblong ferruginous frots: the fides the fame, marked with lucid

DESCRIPTION'S.

fpots:

^{*} Pl. enl. 62. + Sloan. Jam. vol. ii. p. 313. t. 255. f. 3.

fpots of a ferruginous colour, which are broadest at the tip of the feathers: the throat ferruginous white: belly and thighs whitish, marked with longitudinal broadish cinereous spots: upper tail coverts quite white: quills spotted with white on the inner webs, chiefly at the tips: tail even at the end, and inclining to ash-colour: legs pale green: claws blackish.

PLACE.

Inhabits lower Egypt, about Cairo; builds in sycamore and date trees; and feeds on frogs, infects, and small fish, which last it meets with in the fields when they are overflowed. Its cry is not unlike that of the common Crow.

Linneus has fet this down with the fynonyms of his Alcedo rudis, our last species; but, as it seems to differ both in size and colour, I have fome suspicion about it, and have therefore given Hasselquist's description of the bird, that the reader may form his own judgment.

NEW GUINEA

DESCRIPTION.

Le Martin pêcheur de la Nouvelle Guinée, Son. Voy. p. 171. t. 107.

HIS is described as equalling the others in fize. and irides blackish: the whole of the plumage black, fpotted or marked with white; the spots of an irregular form: the head, back, and wing coverts, are marked with small round fpots: quills and tail the fame; but the fpots are of twice the fize: the neck and belly are marked with longitudinal white spots, each feather having a stripe down the middle: on each side of the neck are two large white spots, the one above the other, the space between which is narrow, and spotted like the rest of the neck; the upper one is in the shape of a pear, with the point upwards,

upwards, and fomewhat oblique; the under one is round: the legs are blackish.

This inhabits New Guinea.

PLACE.

Great Gambia Kingfisher, Edw. i. pl. 8.

DESCRIPTION.

ENGTH ten inches. Bill two inches and a half long, and of a red colour: the head, neck, and under parts of the body, fine chestnut, deepest on the head and hind part of the neck: throat dirty yellowish white: the wing coverts, nearest the body, violet black; the outer ones beryl blue: the ten prime quills have their lower half of the same colour on the outside, and white within; the rest of their length black: the rest of the quills are beryl blue on the outer webs, and black within, their whole length: the tail beryl blue above; the side feathers blackish within; beneath, all the feathers are black: legs red: claws brown.

PLACES.

Inhabits Gambia and Madagascar.

VAR. B. GREAT BENGAL K.

DESCRIPTION.

Le grand Martin pescheur de Bengale, Bris. orn. iv. p. 501. N° 14. Martin pêcheur de la côte de Malabar, Pl. enl. 894. Great Bengal Kingsisher, Alb. iii. pl. 28.

ENGIH ten inches and a half. The bill measures two inches and three quarters, and is of a bright red colour: the irides of a fine yellow: the head and hind part of the neck of a fine chestnut, which extends a little way on the back: the back, scapulars, rump, and upper tail coverts, light blueish green: throat,

throat, fore part of the neck and breast, and upper part of the belly, white; on each side of the last are sive brown spots, pretty large: lower part of the belly, thighs, under tail coverts, and sides, chestnut: wing coverts part blue, part chestnut: outsides and tips of the prime quills blue green; the insides and under parts blackish: legs and claws orange.

Inhabits Bengalis And Andrew Milliams

PLACE.

Le Martin-pêcheur à tête & cou colour de paille, Buf. ois. vii. p. 190. Martin-pêcheur de Java, Pl. enl. 757.

8. WHITE-HEADED K.

HE length of this beautiful species is twelve inches. The bill is near three inches long, and red: the head, neck, and under parts of the body, are white, with a tinge of straw-colour: chin white: the top of the head is streaked with black: the wings and tail are of a deep greenish blue: the back blue green: the quills brown, edged with blue.

Description.

Inhabits the *Island of Java*. Buffon feems to think that the Ten-rou-joulon, a Kingsfisher so named by the natives of the island of Celebes, may be a species little or no ways different from the above, though much less in size; for it is said to be no bigger than a Lark. The bill of it is red: and the head and back green: belly yellowish: and the tail of the finest blue imaginable. I do not see so great a similitude in these two as Buffon; for the head in this last is expressly said to be green.

PLACE.

CRAB-EATING K.

Le Martin pêcheur Crabier, Buf. oif. vii. p. 183 .- Pl. enl. 334.

DESCRIPTION.

ENGTH twelve inches. Bill of a deep rust-colour: upper part of the body and tail fine blue green: the outer edges of the quills the same, with black tips: on the wing coverts a large bed of black: behind each eye a streak of black: the under part of the body pale sulvous yellow: legs ferruginous.

PLACE.

Inhabits Senegal, where it is known by the name of Crabier.

Martin-pescheur à tête grise du Sénégal, Pl. enl. 594.

Alcedo semicarulea, Forschal Faun. Arab. p. 2. No 5.

DESCRIPTION.

SIZE of a Starling: length nine inches. The bill full two inches long; the upper mandible red; the lower black: the head, throat, and neck, are of a light grey, deepeft on the head: between the bill and eye is a black mark, reaching to the eye: back and scapulars blue: the lesser wing coverts, and some of the greater ones nearest the body, are black: the greater ones black, with the outer edges blue: the quills on the inside, at the base, white; the outer margins blue green; the rest of them for their whole length, and the tips, black: tail black; the upper surface of the two middle feathers, and the outer edge of all the others, blue green: the legs are black.

Inhabits

Inhabits Senegal; found also about Yemen, in Arabia, by Forschal, who minutely describes it.

PLACES.

VAR. B.

Description.

ENGTH above nine inches. Bill ftrait; an inch and a half long, and red: irides hazel: head and neck dusky white: wings black, with a bar of blue across the middle: the breast and belly are ferruginous: some of the feathers of the former have yellowish margins: the inside of the wings is first ferruginous, then whitish, and afterwards dusky: the upper part of the tail is blue, the under dusky: legs red.

PLACE AND MANNERS.

This is a Variety of the former, and is found at St. Jago, particularly in a small islet in the harbour, called Quail Island. It feeds on large land Crabs of a blue colour, whose numerous habitations are round and deep holes in the dry parched soil.

PLACE.

This is found also in Abyssinia, as appears from a drawing of Fames Bruce, Esq. *

Le Martin-pêcheur bleu & noir du Senegal, Buf. ois. vii. p. 194. Martin-pêcheur du Senegal, Pl. enl. 356. 1.

VAR. C.

HIS is a trifle bigger than the common Kingsfisher: length feven inches. The bill is rusous: the upper part of the head and neck deep blue: the back, the secondary quills, and tail, deep blue: wing coverts and greater quills black: the throat is white, with a blueish tinge: the rest of the under parts rusous yellow: the legs reddish.

Description.

Inhabits Senegal.

PLACE.

Le

WHITE-1 COLLARED K. Le Martin-pêcheur à collier des Indes, Brif. orn. iv. p. 481. N° 5. t. 37. f. 2. A.

DESCRIPTION.

THIS exceeds our Kingslisher much in fize, and is in length fix inches and three quarters. The bill is almost an inch and three quarters long, grey at the base, and blackish towards the tip: the plumage above is of a fine blue; beneath rusous; on the throat very pale: above the eye, from the base of the bill, passes a white line, and another round the neck like a collar: under the eye is a spot of rusous: the rump and upper tail coverts are of a fine green: the legs are grey; and the claws blackish.

PLACE.

Inhabits the East Indies.

GREEN-HEADED Le Martin-pêcheur à tête verte, Buf. oif. vii. p. 190. Martin-pêcheur à tête verte du Cap de Bonne Esperance, Pl. enl. 783.

DESCRIPTION.

ENGTH nine inches. The bill blackish: the head is green, furrounded by a streak of black, giving the bird the appearance of wearing a green hood: the back is of the same colour, which changes on the wings and tail to blue green: the throat and neck are white: under the tail, and the legs, blackish. This is the whole of the above author's description. I observe that all the under parts of the body are white in the Pl. enl.: the seathers which fall over the thighs yellowish: and the quills dusky black.

FLACE.

This bird inhabits Bouro, one of the Molucca Islands.

Lev. Muf.

SACRED K.

DESCRIPTION.

the length is nine inches and a half. The bill is strong, depressed, an inch and three quarters long, and of a lead-colour; but the under part of the lower mandible is white: the head and below the eye, on each side, as well as the upper parts of the body, are of a light blue green, darkest about the ears: over the eye is a stripe of pale ferruginous, beginning at the nostrils, and meeting at the back part of the head: under the blue beneath the eye, a narrow orange ferruginous stripe; and beneath that, on the nape, is a blue band: quills and tail blackish; the outer edges blue, and when closed appear wholly blue: all the under parts are white, with a tinge of buff-colour passing round the neck as a collar: the legs are black.

This, and its Varieties, inhabit Otaheite, and the other Society Islands in the South Seas.

PLACE.

VAR. A.
DESCRIPTION.

THE first Variety has a white band over the eye to the hind head, instead of ferruginous: beneath this band, at the nape, is one of black, which in the other is blue: the scapulars also are much more inclined to green, and darker than in the former bird; and the white on the neck, and the sides of the breast, has each feather fringed with ash-colour: the knees of both are black a very little way up on the outside. I observed in one of these a slender black line, which divided the white collar on the neck, exactly in the middle.

VAR. B.
PL. XXVII.
DESCRIPTION.

ANOTHER Variety, faid to come from Ulietea, was of the fame fize as the above. Bill the fame: the crown of the head greenish black: over the eye a ferruginous streak: beneath, and behind the eye a broad streak of black, which passed to the hind head, and encompassed it all round: chin white: neck, breast, and belly, pale ferruginous; this colour encompassing the neck like a collar: each feather of the throat, neck, and breast, margined with dusky: outside of the thighs blackish, as in the others: back and wings like the head: rump pale blueish green: quills and tail feathers blackish, with blue margins: legs dusky.

VAR. C.
Description.

A THIRD Variety, from New Zealand, differed in having the crown blue: rest of the head black: throat, and round the neck, white: a streak over the eye, the hind part of the neck, and the belly, buff-coloured: vent black: wings and tail blue: round the knee black: legs brown.

PLACE.

This was found at Dusky Bay, where it is called Ghotarré.

All the above have come under my inspection: whereby it is manifest, that this species is common to many parts of the South Seas; and, if I am not mistaken, not far different from N° 11, which is found in the Molucca Isles; which, if not the same, is a species nearly allied to this; but in the Molucca one no part of the under mandible is white.

Sacred Kings-fisher.

Le Martin-pêcheur à collier blanc des Philippines, Son. Voy. p. 67. t. 33. —Buf. oif. vii. p. 192.

VAR. D.

THIS is no doubt a further Variety. Sonnerat fays, it is less than a Blackbird: the bill black; the lower mandible yellowish at the base: head, back, wings, and tail, blue tinged with green: the under parts of the body white, extending round the middle of the neck like a collar: legs blackish.

Inhabits the Philippine Islands.

DESCRIPTION.

PLACE.

Lev. Muf.

VENERATED K.

DESCRIPTION.

ENGTH nine inches. Bill an inch and three quarters long, much depressed, and of a black colour; but the base, for above half an inch, of the under mandible is white: the upper parts of the body are light brown; in some parts mixed with greenish feathers, in others tinged only with glossy green: from the eye to the hind head this last colour is very conspicuous, forming a kind of wreath round the back part of the head, at which place it inclines to white: the wing coverts are brown, many of them margined with green: the secondaries are also brown with green margins, and many of them as long as the greater quills, which are only edged with green for about half their length: the under parts of the body are very pale: the tail is not quite four inches in length, rounded at the ends, and coloured as the quills: the shafts of both quills and tail are chestnut: legs dusky.

This

624

PLACE.

This species inhabits Apye, one of the Friendly Isles, where it is held as facred among the natives as that of Otaheite.

RESPECTED K.

DESCRIPTION.

SIZE of our common Kingsfisher: length eight inches and a half. Bill depressed, black, and an inch and a half in length; the lower mandible white: the upper parts of the body olivegreen: over the eye a white streak: round the neck a collar of greenish black: the under parts of the body white: tail longish: legs black.

PLACE.

Inhabits Otaheite, where it is called Erocro. It is accounted facred *, and not allowed to be taken nor killed.

BLACK-CAPPED K. Le Martin-pêcheur à coifie noire, Buf. oif. vii. p. 189. Martin-pêcheur de la Chine, Pl. enl. 673.

DESCRIPTION.

HIS bird is ten inches in length. The bill is large, and of a bright red: the head and hind part of the neck are black:

The whole of the birds described under this and the two former numbers, are held in a kind of superstitious veneration by the natives of the places they severally inhabit, perhaps on account of their being frequently seen slying about the Morais or burial-places; See Parkinson's Journ. p. 70. But the Kingsfisher is not the only animal held sacred by those islanders, as Herons, Rats, and Flies enter the same list; See Park. Journ. Errat. p. 22. Forst. Voy. i. p. 519. Women and children, I have been informed, were most asraid of doing injury to the Kingsfishers; yet all persons, it is plain, did not mind it, for some of the natives were ready to point them out for our people to shoot at; Forst: Voy. i. p. 378. I fancy, therefore, the whole was no more than what is paid by tender minds to the Robin and Wren in England, only carried to a greater extreme.

the back, the tail, and middle of the wings, are of a deep gloffy violed blue: the shoulders and ends of the wings are black: the throat, fore part of the neck, and breast, are white, and encircling the neck at the lower part, near the back: the belly is of a pale rusous-colour: legs pale red.

Inhabits China.

PLACE.

- Martin-pêcheur de L'Isle de Luçon, Son. Voy. p. 65. t. 31.

15. VAR. A.

DESCRIPTION.

SONNERAT describes this of a size less than a Blackbird; and says, that the bill is large, and the legs small, as in other Kingssishers. The top of the head, and hind part of the neck, are brown; this colour surrounds the eye, and passes below it on each side, to the middle of the upper mandible: from the nostrils to the eye is a whitish stripe: the upper parts and middle of the back are brown: rump and upper tail coverts glossy sky-blue: the tail deep blue: the wing coverts are brown like the head: quills blackish-blue in the middle, and dull black at the ends: the throat, fore part of the neck, breast, belly, and under tail coverts, are white; in the middle of each feather is a longitudinal brown streak: on the lower part of the neck the white passes behind, forming a kind of collar: we are not told of what colour the legs are; nor is that of the bill mentioned.

Inhabits the ifle of Luzonia.

PLACE.

15. VAR. B. Lev. Mus.

DESCRIPTION.

ENGTH ten inches. Bill thick at the base, two inches and a half in length, and of a red colour: the general colour of the upper parts of the body is black, mixed with ferruginous; the feathers of the head longish: the quills and tail are blue green, with the inner webs and shafts dark-coloured: the throat and breast are white; on the last some of the feathers are tinged with pale green: the belly ferruginous brown: legs red.

PLACE

Inhabits the South Sea, but what part uncertain.

± COMMON K. DESCRIPTION.

HIS is the most beautiful of all the British birds: the length is seven inches, the breadth eleven inches, and the weight one ounce and a quarter. The bill is near two inches long, and black; but the base of the lower mandible is yellow: the irides red: the top of the head, and sides, and wing coverts, are of a dark green, marked with transverse spots of a brighter and very lucid blue:

blue; the green changing in fome lights to deep blue: the tail is also of a deep blue: but the middle of the back and tail coverts are wholly of the bright azure: at the base of the upper mandible is an orange spot, at the upper corner of which is a small patch of white, and under that a black mark: behind the eye is a broad stripe of a rusous orange-colour, passing a little way on each side the neck, and beneath this, a patch of white: the chin is white, with a tinge of rusous: and the rest of the under parts of the body rusous orange: the legs are red.

This bird is found not only in England, but throughout Europe, Asia, and Africa; as specimens, precisely the same with ours, have been received from both China, Bengal*, and Egypt; Belon + also remarks his having met with it in Romania and Greece; and Scopoli‡ notices it as a bird of Carniola, where he says it remains the whole year, as in England; and indeed it bears the rigour of the colder climates so well, that among the Germans it has gained the name of Eiszvogel, or Ice Bird §: Olina speaks also of its not regarding the ice and cold ||; and Gmelin assures us, that it is found even in Tartary and Siberia **: but, however this may be, there are few winters in which many of these birds do not perish, I make no doubt, from cold merely; as, to my knowledge, several have been found frozen stiff, by the sides of even running water, without the least mark of violence about them.

M. D'Aubenton has kept these birds for several months, by means of small fish put into basons of water, on which they have fed; for, on experiment, they have refused all other kinds of nourishment.

 PLACE AND MANNERS.

The Kingsfisher lays its eggs, to the number of seven or more, in an hole in the bank of the river or stream it frequents, for it makes no nest. It is observed *, that the remains of the fish which it feeds on, do by no means foul the habitation, as it brings up the indigestible parts in pellets, like the birds of prey,

This bird has given rife to very many poetical and other fictions, which have been treated of so largely by my friend Mr. Pennant +, that no more need be said on this head; yet in one thing I shall advise the reader, which is, not to trust his wardrobe to the guardianship of this bird, for I have sound it just as liable to be destroyed by Maths as any other ‡.

16. VAR. A. Le Martin-pescheur du Senegal, Bris. orn. iv. p. 485. N° 7. pl. 39. f. 1. Le Baboucard, Bus. ois. vii. p. 193.

DESCRIPTION.

SIZE of the last: length fix inches and a half. The bill not quite one inch and three quarters long, and brown: the head and hind part of the neck are dull green; each feather tipped with a brighter green spot: on each side the head are two sulvous spots, the one between the bill and eye, the other behind the eye, but this last is very small: the back is sine blue-green, with a small mixture of brown: rump and upper tail coverts bright blue-green: the throat pale yellow: the under parts of the body orange: the scapulars dull green: the wing coverts dull green, tipped with bright blue-green: quills brown; the outer

Description.

I ENGTH near five inches. Bill almost an inch and a half long, and black: the feathers on the crown are longish, and form a crest; these are greenish, transversely barred with black: on each fide the neck is a fine blue stripe, beginning at the eye, and passing a little way down the neck: the back, rump, and upper tail coverts, bright blue: scapulars violet: the cheeks are rufous, which colour passes down on each side of the neck: the throat rufous white: the fore part of the neck, and under parts of the

the body, pale rufous: the upper wing coverts violet; each feather tipped with a bright blue spot: all the quills are brown, but the edges of the lesser ones are violet: the tail the same; the whole of the two middle feathers, and the outer edges of all the others, violet: the legs and claws are reddish.

Inhabits Amboina and the Philippine Islands. The natives of the first give it the names of Tohorkey and Hito, and those of the last Vints.

PLACES.

Le Martin-pescheur hupé des Indes, Bris. orn. iv. p. 506. N° 17. Alcedo cristata, orientalis elegantiss. pista, Seba i. p. 104. t. 67. f. 4.

22. Var. A.

THIS measures five inches and a half in length. The bill is above an inch and a quarter, and of a light red colour: the head is marked and crested as in the last bird: the upper parts of the body are the same: the wing coverts bright beryl-blue, but not spotted as in the last: the wings and tail are also the same: the colour of the legs not mentioned.

Description.

This bird is described from *Seba*, who merely informs us that it is met with in the *East Indies*. It is most likely a variety of the last mentioned.

PLACE.

Le Martin-pescheur des Indes, Bris. orn. iv. p. 479. Nº 4. pl. 37. f. 1. A.

EASTERN K.

THIS is one-third less in size than the common Kingssisher: length four inches and a half. Bill sixteen lines long, and red: the upper part of the head, and the throat, are of a fine blue: on each side, from the base of the bill, is a stripe of the 4 M fame,

Description.

fame, passing through the eyes to the hind head: over the eyes a stripe of white: and beneath the eye a rusous spot: the upper parts of the neck, body, wings, and tail, are very bright green, and the under parts rusous: the quills are blue: and the tail feathers green on the outer eeges: legs and claws black.

PLACE.

This inhabits the East Indies. Brisson described it from a painting sent to him from M. Poivre.

TERNATE.

Alcedo dea, Lin. Syst. i. p. 181. No 13: Le Martin-pescheur de Ternate, Bris. orn. iv. p. 525. No 26. pl. 40. f. z. —Pl. enl. 116.

Le Martin-pêcheur à longs brins, Buf. ois. vii. p. 196. Martin-pêcheur des Moluques, Salern. orn. p. 126. No 10.

DESCRIPTION.

Bill short, and above half an inch thick at the base, and an inch and three quarters long; the colour a fine orange: the head and hind part of the neck are glossy blue, lightest on the top of the head: the back and scapulars brown, margined with deep blue: wing coverts blue: quills the same; the insides and tips black: the under parts of the body and rump white, with a tinge of rose-colour: the tail consists of ten feathers; the two middle ones are very long, and exceed the next by four inches, and the outer ones by five inches and a half; the two long feathers are webbed only about one-third from the base, and at the tips, the intermediate parts almost naked, and of a blue colour; the base and tips rose-coloured white, with a blue spot on the outer web; the rest of the tail feathers are of a rosy white, with the outer edges brown: the legs and claws are reddish.

The

The long tail feathers in the male are faid to be longer than in the female by one-third.

Inhabits Ternate, one of the Molucca Isles.

PLACE.

Le Martin-pescheur de Cayenne, Bris. orn. iv. p. 492. Nº 10. Le Taparara, Bus. ois. vii. p. 207.

CAYENNE K.

THIS is very little less than a Starling, and is near nine inches and a half in length. The bill is two inches; the upper mandible black, the lower red: the hind part of the neck, the back, and scapulars, are of an elegant blue: rump and upper tail coverts bright beryl-blue: beneath the hind head is a transverse band of black: the under parts of the body are white: wing coverts blue: quills edged with blue: tail the same; but the two middle feathers wholly blue: the legs red.

Description.

Inhabits Cayenne and Guiana, at which last place the natives call all the Kingsfisher tribe by the name Taparara. In this part of South America, which contains many rivers full of fish, many Kingsfishers in course are likely to be found; and this is really the case, for they abound in vast numbers; but what is remarkable, they never herd together, always being found single, except in breeding-time, which M. Le Borde, who has observed them, says, is about the month of September. They lay their eggs in the holes of banks, like the Kingssisher of Europe. The cry of this bird imitates the word Carac.

Achalalactli, Raii Syn. p. 126.—Will. orn. p. 390.

DESCRIPTION.

in length. The bill is three quarters of an inch thick at the base, and more than three inches and a half long, and brown; the base of the lower mandible reddish: the head is crested: the irides are whitish: the upper parts of the head and body are blueish ash; the under parts chestnut: the throat is whitish, descending down the neck, and passing behind like a collar, ending towards the back in a point: between the bill and eye is a spot of white: the thighs are sulvous, mixed with white: the under tail coverts pale sulvous, transversely striated with black: lesser wing coverts varied with blueish ash, black, and yellowish; nearest the body, blueish ash spotted with white; farthest from the body, blackish, spotted white on the outsides and tips: the greater quills are marked in the same manner, as is the tail: the legs are red: the claws blackish.

PLACES

Inhabits Martinico and Mexico; at the last place it is called Achalalastli. This bird migrates into the northern parts of Mexico at certain seasons only, and is supposed to come there from some hotter parts. Buffon thinks it cannot be the bird which M. Adanson * says is found in Senegal, since the two parts of the world are so far asunder; and the bird itself, as well as all of the genus, incapable of long slights.

Belted Kingsisher, Am. Zool. No.

BELTED K.

Lev. Muf.

SIZE of a Blackbird: length ten inches and a half. The bill is two inches and a half long, and black: the head crefted: general colour of the plumage blueish ash above, and white beneath: on each side the head are two white spots, one between the bill and eye, and another beneath the eye: round the neck is a collar of white; under this, on the fore part, the neck is blueish ash: on the breast is a transverse chestnut band, three quarters of an inch in breadth: the greater wing coverts and second quills have white tips: the prime quills black, with transverse spots of white on the inner webs, and tipped with white: the tail tipped with white: legs and claws brown.

Description.

Inhabits Carolina, where it feeds on lizards and fish.

PLACE.

Martin-pêcheur de la Louisiane, Pl. enl. 715. Crabcatcher, Sloan. Jam. ii. p. 313. N° 54. t. 55. f. 3. Lev. Mus.

27. -- VAR. A.

ENGTH eleven inches and a half. Bill two inches and three quarters, and of a very dark brown: irides red: the head deep lead-colour, and crefted, each feather being very dark down the middle: between the upper mandible and eye a fpot of white: the chin and fore part of the neck half way down white, and this extends.

Description-

extends round the neck, forming a collar of an inch in breadth at the hind part: below this the neck is of a blueish ash-colour for about one inch in breadth; and this colour passes backwards to communicate with the hind part of the neck, which, as well as the back, wings, and tail, is of the same colour: the breast and belly are deep ferruginous, and are separated from the blue ash on the neck by a line of white: the vent and thighs are also white: most of the wing coverts are tipped with white: the secondary quills marked with a larger spot of the same: the bastard wing and quills are black, tipped with white; the last clouded with white on the outer web, about the middle of each feather: the tail is spotted with white on both webs; and the tips of all the feathers are white: the legs are red.

Difference of Sexes.

The other fex differs somewhat; for all the under parts of the body are white, and the white collar at the back part of the neck is very narrow, but otherwise like the above. I received a pair of these, in fine condition, from Jamaica, where they are pretty common. Sloane says that his bird seeds on testacea; haunts watery places near the sea; is usually perched on trees, and makes a chattering noise very loud. It is not eatable, or at least good palatable sood. These appear to me strong varieties, bearing place between the last and following species.

fing through the eyes: the greater quills and tail are rufous, marked with transverse spots of white: legs and claws brown.

PLACE.

Inhabits Brafil. Its cry is like the word Gip-gip; not unlike that of a young Turkey.

SPOTTED K. Alcedo inda, Lin. Syst. i. p. 179. Nº 2. Spotted Kingsisher, Edw. glean. pl. 335.

DESCRIPTION.

HE length is seven inches. The bill dusky; the base of the lower mandible orange: a broad black line runs from the bill through the eyes, on each side of the head: above and beneath this are lines of orange-colour: crown of the head black, changing to green at the back part: the sides of the head, beneath the eyes, green: this colour also covers the upper parts of the neck, body, wings, and tail; but the feathers of the two last, with the rump, are spotted with white on the edges: the under parts of the body are orange-colour: between the neck and breast is a broad black band, edged with pale ash-colour.

PLACE.

Inhabits Guiana.

SURINAM K.

DESCRIPTION.

Martin-pescheur, Ferm. Descr. Surin. vol. ii. p. 181.

HIS species (if a distinct one) is less than a Blackbird. The bill black, thick, strait, pointed, and two inches in length: the inside of the mouth saffron-colour: the top of the head greenish black, transversely spotted with blue: the back blue, obscurely shaded with lines of black: the quills of a greenish blue: the tail short, and of a dull blue: the chin and middle of the belly white.

white, with a mixture of red: the lower part of the belly, and beneath the wings, inclining to rufous: the breaft is rufous, the feathers of which are tipped with light blue: the legs small; the colour of them not mentioned.

This is found at *Guiana*, where it frequents, and makes its neft in holes about the water. According to *Mr. Fermin*, it lays five or fix eggs, and feeds on fish.

This bird feems to bear fome affinity to the last, being of the same size, and found in the same place; but I have not ventured to place it as a variety, or sexual difference of that bird, till surther authority.

SUPERCILIOUS

ENGTH five inches. Bill fixteen lines in length, and of a blackish colour: the base of the lower mandible reddish: the crown, hind part of the neck, the back, and rump, are green; as are the scapulars, upper wing and tail coverts: from the bill, over the eyes, passes a narrow orange stripe: the throat and fore part of the neck are orange: on the breast is a transverse green band: the belly, thighs, and under tail coverts, are whitish: the sides reddish orange, very bright: inner coverts, and ridge of the wing, paler orange: quills black brown, spotted on both webs with rusous yellow: the two middle tail feathers are green; the

Description.

others are green also, but spotted on the inner web with white: the legs are flesh-colour: claws blackish.

PLACE.

This is the description of Brisson, who merely says, that it is found in America.

The bird figured by *Edwards* appears to have only a fpot between the eyes and bill, and not continued over the eyes. The bill in his figure feems a little bent.

Those referred to in Buffon, seem likewise to vary a little; he describes both sexes; both of them have a half collar of orange at the back part of the neck: the whole of the under parts of the body bright orange, except a spot of white on the throat, and another on the stomach *: but the green band on the breast is wanting in the female, otherwise the above description might serve.

Buffon received these from Cayenne.

WHITE-BILLED K. Le Martin-pescheur deu d'Amerique, Bris. orn. iv. p. 505. Nº 16. Le Martin-pescheur dec blanc, Bus. ois. vii. p. 200. Alcedo Americana, seu apiastra, Seba, i. t. 53. f. 3.

DESCRIPTION.

ENGTH four inches and three quarters. The bill more than one inch and a quarter, and whitish in colour: the head, and hind part of the neck, purplish chestnut: back, scapulars, rump, and upper tail coverts, bright blue green: the lesser wing coverts, and the greater ones, which are nearest the back, are the same

* I have feen one of these, with one white spot only, and that placed on the middle of the belly; and another, wherein the middle of the belly and vent were white. In this last bird there were some orange spots between the bill and eye, but not a stripe.

colour a

colour: those farthest from the body, and the quills, greyish ash: the under parts of the body are pale yellow: the tail is blue above, and cinereous beneath.

This is copied from Seba, who fays it inhabits America.

PLAGE

** WITH THREE TOES ONLY.

THREE-TOED

The fize is much less than that of the common one: the length is about four inches: the one has the crown ferruginous, with a violet tinge: on the temples is an azure spot, and beneath it a longitudinal white one: between the shoulders and the tips of the wing seathers, azure: the cheeks, and under parts of the body, yellowish white: the throat pure white: the quills ferruginous black; but ferruginous on the inner margin: the tail is ferruginous.

The other bird is rufo-ferruginous above: the crown, rump, and tips of some of the back feathers, tinged with violet: the breast is more ferruginous, and the belly of a purer white than in the other: the azure spot on the temples also is wanting in this bird: the bill in both is square, and of a yellowish white colour: but the distinguishing character of the species, is having only three

DESCRIPTIONS.

three toes; two being placed before, and one behind: the legs are the fame colour as the bill.

PLACE.

Inhabits the East Indies.

Sonnerat fays, it is the most brilliant of birds. The bill is long in proportion: the whole head, and upper parts of the body, deep lilac: wings blue black: quills edged with blue: under parts of the body white: legs reddish: toes only three in number.

This was found at Luzonia; and, no doubt, is the same bird as the first described.

Br. Muf. Lev. Muf.

Description.

HIS bird, as described in the British Zoology, weighs near an ounce, and is in length five inches and three quarters. The bill is strong and strait, about three quarters of an inch long; the upper mandible black; the lower white: irides hazel: the crown of the head, back, and wing coverts, are of a fine blueish grey: a black stroke passes over the eye from the mouth: the cheeks and chin are white: the breast and belly of a dull orange-colour: quills dusky: the wings beneath marked with two spots; one white, at the root of the exterior quills, the other black, at the joint of the bastard wing: the tail consists of twelve feathers; the two middle ones are grey; the two exterior tipt with grey; then succeeds a transverse white spot; beneath that the rest is black: legs pale yellow: claws large; the back one very strong.

FEMALE.

The female is like the male, but less in size; and weighs commonly five, or at most six, drams.

MANNERS.

The eggs are fix or feven in number, of a dirty white, dotted with rufous; these are deposited in some hole of a tree, frequently one which has been deserted by a *Woodpecker*, on the rotten wood mixed with a little moss, &c. If the entrance be too large, the

bird nicely stops up part of it with clay, leaving only a small hole for itself to pass in and out by. While the hen is sitting, if any one puts a bit of stick into the hole, she hisses like a Snake, and is so attached to her eggs, that she will sooner suffer any one to pluck off her feathers than sly away. During the time of incubation, the male supplies her with sustenance, with all the tenderness of an affectionate mate.

The general food confifts of Caterpillars, Beetles, and all forts of infects, as well as nuts. Willughby observes, that it is a pretty spectacle to see her fetch a nut out of her hoard, when, placing it fast in a chink, she stands above it, with the head downwards, and, striking it with all her force, breaks the shell, and catches up the kernel.

This bird runs up and down the trees like the *Woodpecker*, is folitary, and often moves the tail like the *Wagtail*; it does not migrate, but changes its fituation in winter, as it often, at that time, approaches inhabited places, fometimes coming into orchards and gardens. The young are accounted good eating.

It is supposed not to sleep perched, like other birds, on a twig; for it has been observed, that when kept in a cage, notwithstanding it would perch now and then, yet at night it would, if possible, creep into some hole or corner to sleep in; and it is remarkable, that when perched, or otherwise at rest, it has mostly the head downwards, or at least even with the body, and not elevated like other birds.

VAR. A. LESSER N. Le petit Torchepot, Bris. orn. iii. p. 592.—Belon. Hist. des ois. p. 305. La petite Sittelle, Bus. ois. v. p. 470.

DESCRIPTION.

IT is from Belon that we are furnished with an account of this bird; no one besides seems to have seen it: he says, it is in all things like the other, except in being much smaller, but far more noisy. It is seldom seen alone, being mostly in company with its mate, and is very quarressome; for on meeting with another of its race it attacks it, nor ceases to sight till its enemy yields the victory.

La Sittelle à tête noire, Bus. ois. v. p. 473. var. 5.

Smaller Loggerhead, Brown Jam. p. 475.

The Nuthatch, Catest. Car. i. pl. 22.

DESCRIPTION.

CATESBY fays, that this bird weighs thirteen pennyweights five grains: its length five inches and a quarter. Bill three quarters of an inch, and black: top of the head, and neck, black: the rest of the parts above cinereous: the under parts whitish, except the lower belly, and under tail coverts, which are rusous: quills blackish, edged with cinereous: the two middle tail feathers cinereous; the others spotted with black and white: legs and claws brown.

The male and female are much alike.

PLACES.

These breed and remain the whole year in Carolina; they are also found in Jamaica.

Sitte

Sitta Europæa, Lin. Syft. i. p. 177. No 1. s. Le petit Torchepot de la Careline, Brif. ern. iii. p. 598. No 5. La petite Sittelle à tête brune, Buf. oif. v. p. 474. var. 6. Small Nuthatch, Catefo. Car. i. pl. 22. Loggerhead, Slean. Jam. p. 391. t. 259. f. 2. not exact.

VAR. C.

HIS is less than all the former, being in length only four inches and one-third. The bill seven lines long, and black: the upper parts of the head and neck are brown: on the hind head there is a dirty white spot: the upper parts of the body, wings, and tail, ash-coloured: the under parts dirty white: upper wing coverts brown: quills deep brown, with paler brown edges: the two middle tail seathers cinereous; the rest black: legs and claws brown.

DESCRIPTION.

It is found in Carolina the whole year: it feeds on infects, as does the last mentioned. It is also met with common in Jamaica, in the favannas, among the bushes; and has obtained the name of Loggerhead, from its stupidity, as it frequently suffers men to come so near it as to knock it down with a stick.

PLACES.

+ CANADA

HIS is smaller than our Nuthatch: length four inches ten lines. Bill seven lines and a half long, colour blackish ash: the upper parts of the body are cinereous: throat and cheeks 402 whitish;

DESCRIPTION

whitish; the rest of the under parts pale rusous: the nostrils are covered with bristly seathers of a whitish colour, and turned forwards, as in the others of this genus; from these passes a stripe of white over the eyes: behind the eyes is another stripe of a blackish colour: the greater wing coverts are brown, with cinereous edges: quills the same; all except the first have the outer edges cinereous, the inner whitish; the two middle tail seathers are cinereous; the next black, with the end cinereous; and the four outer ones black on each side, the ends on the outside cinereous, and the inside white: legs and claws grey-brown.

PLACE.

It is found in Canada; and has the manners of the rest.

JAMAICA N. Sitta Jamaicensis, Lin. Syst. i. p. 178. N° 3. Le Torchepot de la Jamaique, Bris. orn. p. 594. N° 3. La Sittelle à huppe noire, Bus. ois. v. p. 472. Sitta major capite nigro, Raii Syn. p. 185. N° 33. Loggerhead, Brown Jam. p. 475.

Description.

SLOANE fays, that it has a large head, and is about the fize of our Nuthatch: length near five inches and a half. Bill ten lines long, and black: the crown of the head is black: upper parts of the body cinereous; the under parts white: quills blackish, with cinereous edges: tail blackish; all the feathers, except the two middle ones, marked with transverse lines of white towards the ends: legs and claws black.

PLACES.

Inhabits Jamaica and Guiana, and feeds on infects. It is found both in thickets and favannas, and is fo very tame and foolish, as to suffer any one to approach it near enough to knock it on the head; whence the name of Loggerhead.

Le

Le petit Torchepot, de la Jamaique, Bris. orn. iii. p. 596. N° 3. A. La petite Sittelle à huppe noire, Bus. ois. v. p. 473. Least Loggerhead, Brown Jam. p. 475.

3. Var. A.

Buffon thinks it very probable that it may be the young one of the last, not at full growth. It is likewise this gentleman's opinion, that the whole of the above-mentioned birds are mere varieties of each other; but, the better to reconcile the other authors who have described them, we have thought right to act with them here as is done above.

DESCRIPTION.

La grande Sittelle à bec crochu, Buf. ois. v. p. 475. Sitta, seu picus cinereus major, rostro curvo, Raii Syn. p. 186. p. 34. Another sort of Loggerhead, Sloan. Jam. p. 301. N° 19.

GREAT N.

DESCRIPTION:

THIS is the largest of the genus: length seven inches and a half. Bill near three quarters of an inch: it is different from the others, being thickest in the middle, and crooked at the end: the nostrils are round: the head and back grey: the throat white: the under parts of the body whitish: quills and tail brown, with the edges orange.

Inhabits Jamaica, and feeds on worms, cimices, and fuch like,

PLACE.

spotted N. La Sittelle grivelée, Buf. elf. v. p. 476, Wall-creeper of Surinam, Edvo. glean. pl. 346,

Description.

THE length is fix inches. Bill one inch, of a dufky brown, and compressed sideways: the head and upper parts of a dark blueish lead-colour: all the wing coverts above tipped with white; the inner ones dusky, edged with white; the throat is white; the breast, and all the under parts of the body, blueish ash-colour, and lighter than the upper parts: from the throat to the legs marked with lines of white down the middle of each feather, ending in points: legs dusky brown.

Inhabits Surinam.

PLACE.

G.
SURINAM
N.
PL. XXVIII.
Description.

HE following is a beautiful species, and I believe the least yet known; the total length being no more than three inches and a half. The bill is a trifle bent, of a dusky brown colour; the under mandible the palest: the head, and hind part of the neck, are rusous chestnut-colour: the forehead is plain as far as the middle of the crown; the rest marked with longitudinal black streaks: the middle of the back appears white, which arises from the inner web of each scapular seather being of that colour: the wing coverts are black, with white tips: the primary quills plain black; secondaries the same, with white margins: under parts of the body dirty white, with a chestnut tinge: the belly dirty white: tail black, even, all the feathers tipped with white: legs black.

PLACE.

This specimen is in the collection of Miss Blomefield, and came from Surinam.

•			
		The second second	
	•		

Sitta (Chinensis) palpebra inferiore purpurea, Ofb. Voy. ii. p. 12.

CHINESE N.

DESCRIPTION.

THIS is a little larger than a Goldfinch. The bill and head are black: the back, from head to tail, dark ferruginous, with a blueish cast: breast and belly white; but towards the throat black: the head is crested, and consists of black feathers, which are longer than the bill: near the eye is an oblong small scarlet spot; and close to this a large one, as white as snow: from the temples to the throat runs a black line: the chin and throat itself are white, but this white is encompassed with black, except a white line in the middle of the breast, which joins the white of the throat with the snowy breast: the rump is yellow: the quill seathers, which are nineteen in number, have ferruginous dark coverts: the tail seathers are twelve in number, and blackish, with white tips.

This bird inhabits *China*, where it is called *Kow-kay-konn*. It is kept more for its beauty, than for its fine fong, for it fings but little. Its food is boiled rice.

I have feen this not unfrequently painted in Chinese paper-hangings.

ILL thin, depressed, broad; base beset with bristles. Nostrils small, oval.

Tongue.

Toes placed three before and one behind; the middle one greatly connected to the outer.

Birds of this genus inhabit the warmer parts of America. They vary considerably in their bills, as to breadth; but all of them have a certain flatness, or depression, which is peculiar. They have great affinity to the Flycatchers; and indeed, to speak the truth, the two genera run much into one another: however, in one thing they differ materially; for in the Tody, the outer and middle toes are much connected, whereas in the Flycatcher genus they are divided to their origin: perhaps more might be brought into this section; but, as many birds are only to be seen on paper, if the draughtsman should not think a just expression of the toes to be a matter of consequence, we must remain in the dark, where the writer has omitted it in the description.

Br. Mus. Lev. Mus.

SIZE of a Wren: length four inches. Bill not quite three quarters of an inch in length; it is very much depressed or flatted, like that of a Duck, and rounded at the tip; the upper mandible is brown, the lower orange: irides hazel: the plumage is of a beautiful and elegant green on the upper part of the body; beneath yellowish white: on the throat is a spot of very fine red: the legs and claws grey.

The male, according to Buffon has the upper part of the body of a pale blue: the belly white: the breast and sides rose-colour.

This pretty species is found in the warmer parts of the American continent; also at St. Domingo, Jamaica, and other islands of the West Indies.

I have had several of these from Jamaica, where they are not uncommon; but have never yet received, nor even seen, the male. I am informed that it is a solitary bird, frequenting the lonely part of moist places, where it is observed to sit all of a heap, its head drawn in between its shoulders, and so stupid as almost to suffer itself to be taken by the hand.

DESCRIPTION.

MALE.

PLACES.

It is supposed to feed on soft insects, and is called at St. Domingo, Perroquet de terre *.

6. WHITE-HEADED T. PL. XXJX.

DESCRIPTION.

Todus leucocephalus, Pall. Spic. 6. t. 3. f. 2. Lev. Mus.

SIZE of a Redstart. The bill is blackish; the base of the lower mandible white: nostrils depressed: base of the bill beset with black bristles: the head and throat white; the first somewhat crested, being pretty sull of feathers: the rest of the body of a dull but deep black: the wings are short: quills, on the inside and tips, brownish: tail short, even at the end, and black: the legs are black: the outer toe joined to the middle one by a membrane.

PLACE.

Inhabits South America.

SHORT-TAILED

Todi species septima, Pall. Spic. 6. p. 18. Lev. Mus.

DESCRIPTION.

ESS than the last. Bill dusky, and much flatted: the fore-head, sides of the head, and under parts of the body, white: the upper parts black: the inner margins of some of the quills, and the shoulders beneath, snow white: tail very short and black: the legs are like those of the last species, and black.

PLACE.

Inhabits America. In distribution of colour it seems much to-coincide with Edw. p. 348; but has a much broader bill, added to the tail being very short.

Todi

White headed Tody.

-	
,	

Todi species tertia, Pall. Spic. 6. p. 17. Br. Mus. PLUMBEOUS

SIZE of a Wren. The bill exactly the same in shape as that of the second species: the upper parts of the plumage hoary lead-colour, inclining to black on the crownt of the head: beneath, from the throat to the tail, white as snow: quills and tail dusky black; the outer edges of the quills white: the tail even at the end: legs dusky.

Description.

Inhabits Surinam.

PLACE.

Todi species quarta, Pall. Spic. 6. p. 17. Br. Mus.

DUSKY

SIZE of an Hedge Sparrow. Bill brown, half an inch long, broad at the base, somewhat indented over the nostrils, and a little curved at the point; the under mandible is white; the base beset with bristles: the upper parts of the plumage dusky olive brown: beneath yellowish white: chin pale: quills and tail the same, edged with grey: the tail two inches in length, and even at the end: legs dusky.

Description.

Inhabits North America, where it frequents the decayed parts of trees; has all the actions of the Flycatcher. It has an agreeable note, two or three times repeated, but not what can be called a fong. It feeds on infects. I have received this from Rhode Island.

PLACES.

KING T. Le Roi des Gobe-mouches, Buf. ois. iv. p. 552. Tyran hupé de Cayenne, Pl. enl. 289.

DESCRIPTION.

HIS fingular and beautiful species measures seven inches in length. The bill is ten lines long, very broad at the base, and quite flat, tending to a point at the tip, where it is a little bent; the colour of it deep brown; at the base are several black briftles, which project forwards, and are as long as the bill itself: on the crown is a creft of a fingular structure, placed transversely across the head; this is composed of four or five ranges of feathers, one shorter than the other; the longest above three quarters of an inch in length; each feather is rounded at the end, and finishes with a spot of black; the rest of the length red, inclining to chestnut: the hind part of the head, neck, and back, are black brown: this colour passes forwards, and furrounds the neck before as a collar, half an inch broad: the chin is white: and over the eye is a white streak: the wing coverts are reddish brown: the quills dufky: the breaft dufky white, croffed with blackish transverse lines: the belly, vent, rump, and tail, pale rusous; the last the darkest, and two inches in length: the legs are fleshcolour, and rather weak: the outer toe connected to the middle

PLACE.

This inhabits Cayenne, but is very rare.

Lev. Mus.

DESCRIPTION.

ENGTH feven inches and a half. Bill three quarters of an inch, black, very much compressed, and ending in a point, which

which is a trifle incurvated: nostrils oval near the base: at the base of the upper mandible spring four or five slender hairs, pointing forwards: the plumage on the upper parts of the body rusty black, most of the feathers having a ferruginous tinge on the edges: sides of the head spotted dusky and white: chin, and all the under parts, dull ferruginous: over the eyes, and rather behind them, is a short pale streak: quills dusky; the four first are ferruginous on the inner webs, in the middle; most of the other quills are marked the same, but are also ferruginous on the middle of the outer webs, making a bar half across the wing: the legs are dusky: the middle and outer toe connected, as is usual in this genus: the tail consists of twelve feathers, even at the end, two inches and three quarters long, and of a plain dusky brown.

This was received, among some others, from South America; supposed originally to have come from Cayenne. I have lately seen a second of these, which had the upper parts brown instead of black.

that drawn and constitute

TENGTH nine inches. Bill an inch and three quarters long, much compressed, three quarters of an inch broad at the base, and ending in a point; near the end it rather bends upwards; the nostrils are oval, and placed near the base: the plumage is brown above: the chin white: the fore part of the neck and breast the same, but somewhat mottled with brown, which mottling seems to take place round the neck, at the lower part behind, though not mixed with white: belly and vent white: tail three inches long, and rounded at the end: the legs are brown, an inch and a half long; on the shins are seven indented obliques

PLACE.

WHITE-CHINNED

DESCRIPTION.

oblique fegments: the outer and middle toe united; all the toes full of rough fegments, ten in number at least on each: the claws are yellow.

I met with this bird in spirits at Sir Joseph Banks's. It appears to me a curious, and hitherto undescribed bird.

BROAD-BILLED T.

Todi species octava, Pall. Spic. 6. p. 19. t. 3. C. the bill.

DESCRIPTION.

THIS species is the fize of a Nightingale, and is remarkable for the bill, which is very broad, resembling that of the Boat-bill*; it is flat, pointed at the tip, and whitish in colour; the nostrils standing in an hollow at the base: three large bristles, and other small ones, are placed on each side the bill, with some few hairs on the forehead: crown of the head lead-colour, in the middle of which is an oblong white spot, in the manner of the Tyrant Sbrike +: the back is luteous brown: beneath it is luteous: the throat whitish: quills brown: tail even, brown: legs and claws yellowish: outer toes joined to the middle one by a membrane, as far as two joints.

This was described from a specimen in the Museum of the Prince of Orange.

GREAT-BILLED T. PL. XXX.

Lev. Muf.

DESCRIPTION.

HIS species is about the size of the former, and is eight inches in length. The bill is in shape much like that of the last described, an inch and a quarter in length, and very broad at

* Cancroma of Linnæus.

† N° 37. p. 184.

Great-billed Tody.

the base *; the colour of it is blackish blue, the margins and point whitish; the base is beset with several short bristles, and two long ones on each side, nearly of the length of the bill: the general colour of the plumage is black, with a gloss of blue in some lights: the quills and tail dusky black: the chin and sides of the throat, the rump and upper tail coverts, belly, thighs, and vent, are crimson; but in both the last a mixture of black: six of the scapular feathers are white, and pointed at the ends, and hang over the wing coverts in an elegant manner: the outer edge of the wing, a little way from the bend, is white: the legs are black: the outer and middle toe connected: the claws flatted on the sides.

This beautiful species is in fine preservation in the Leverian Museum, but its native place unknown.

See the bottom of the plate for the natural fize and shape.

THIS bird measures, from bill to tail, ten inches. The bil an inch and three quarters in length, and black; the base of the upper mandible covered with dirty white feathers: the irides are red: the forehead is of a blue green colour, behind it green: the top of the head chestnut, tinged with green: hind head and upper part of the neck chestnut, growing paler towards the back: from the bill to the hind head is a black stripe, passing through the eyes: the back and scapulars are of a very pale yellow, tinged with both chestnut and green: rump and upper tail coverts blue

DESCRIPTION.

^{*} Hist. des ois. vi. p. 484.

[†] It must be remarked here, that Kramer does not mean our Kingssisher, either from his descriptions or synonyms.

green, with a yellowish tinge: the throat is yellow: the under parts of the body blue green, growing paler towards the belly: the leffer wing coverts are dull green; the middle ones rusous; and the greater ones of a rusous green: the quills for the most part sea-green without, and many of the inner ones rusous; the first very short; the second the longest of all: the tail is wedgeshaped, and consists of twelve seathers, the shafts of which are brown above, and whitish beneath; the two middle seathers are sea-green, with a shade of rusous; the rest the same, but margined with cinereous within; the two middle seathers exceed the outer ones by three quarters of an inch: the legs are of a reddish brown: claws reddish black.

PLACES AND MANNERS.

This bird inhabits various parts of Europe, on the continent, though not in England; yet is faid to have been feen in Sweden; and flocks of them have been met with at Anspach*, in Germany, in the month of June. They are now and then feen in Lorraine; though only in pairs; and are not unfrequent in other parts, fince Kramer talks of their building the nest in the sandy crags of the Danube. They are met with in Italy, and the south of France; and in Candia, and other islands of the Mediterranean, likewise, they are in plenty, as well as in Palestine and Arabia; being very common in the woods about Yemen, where they are called Schæghagha. We likewise receive this species from Bengal**; and, no doubt, could it be traced, may be found in more places

^{*} Hist. des ois. vi. 485. † Id. ‡ Elen. p. 337. || Willugb. orn. p. 148. § Faun. Arab. p. 1.

^{**} I have one from this place, exactly like the European species, which last I received from Minorca. This last has an even tail, without the elongated middle feathers; but in that from Bengal they were longer than the rest, according to the above description.

than those already mentioned. It takes the name of Bee-eater from its being very fond of those insects; but, besides these, will catch gnats, flies, cicadæ*, and other insects, on the wing, like the Swallow. It is said to be most plenty in the Isle of Candia; and in defect of insects, to eat seeds of many kinds; and Ray † supposes, from its similarity to the Kingssisher, it may possibly feed on sish. Most probably some think it good to eat, as Willughby saw many of them exposed for sale in the markets of Rome. These birds make their nests in deep holes in the banks of rivers, like the Sand Martin and Kingssisher, at the end of which the semale lays from five to seven white eggs, rather less than those of a Blackbird. The nest itself is composed of moss ‡.

^{*} Willighby tells us, from Belon, "that its fingular elegancy invites the Candy boys to hunt for it with cicadæ, as they do for those greater Swallows, called Swifts, after this manner:—bending a pin like a hook, and tying it by the head to the end of a thread, they thrust it through a cicada, (as boys bait a hook with a fly) holding the other end of the thread in their hands; the cicada, so fastened, flies nevertheless in the air, which the Merops spying, slies after it with all her force; and catching it, swallows pin and all, wherewith she is caught." Will. orn. p. 148.

[†] Syn. av. p. 49.

¹ Kramer el. p. 337. who fays, that it feeds chiefly on flies and gnats.

DESCRIPTION.

body: length eight inches and three quarters. Bill thirteen lines and a half long, and black: the upper parts of the body are green gold: the upper tail coverts the fame, but inclining to blue: the under parts of the body are green, changing to blue under the throat: on each fide of the head is a black band, from the bill passing under the eyes: beneath the throat is another band of the fame, like a collar: under the wings fulvous: quills mostly green, with the inner webs more or less fulvous, and beneath chiefly cinereous, and tipped with black: tail green above; the side feathers edged with cinereous on the inner webs; the two middle ones above two inches longer than the others; and, as far as they exceed them in length, are very narrow, and blackish; the webs of all of them are brown above, and whitish beneath: the legs and claws are brown.

That described by *Edwards* has the forehead, cheeks, and throat, blue: breast and belly light green: hind part of the head and neck orange red: between the blue and green on the breast is a black crescent, and a black stroke through the eyes: back and wing coverts parrot green: rump blue green: greater quills black; the middle ones orange, bordered with green, and spotted with black within the tips, which are orange.

Inhabits

Inhabits Bengal.

PLACE.

Mr. Osbeck mentions one not unlike the above, which came from Java, where it was met with alive, but died after a confinement of a few days.

Le Guespier à collier de Bengale, Bris. orn. iv. p. 552. No 9-. Bengal Bee-eater, Albin. iii. pl. 30.

VAR. A.

BUFFON thinks this to be the very same bird with the other; but by the description it is said to be two inches and a half longer, being in total length eleven inches and a quarter; and it differs too from Brisson's, in having the forehead blue, in this being more like that described by Edwards, and most likely is a mere variety of that bird.

DESCRIPTION .:

Merops Ægyptius, Forsch. Faun. Arab. p. 1. No 2. ..

VAR. B.

DESCRIPTION.

faid not to belong to the first species. The only description given is, that the bird is wholly of a green colour: that the throat is yellow: the bill black and straitish: tongue bidentated: tail feathers twelve in number, and even at the end: legs of a slessh-colour.

This, he fays, is met with in Egypt, and that the young are fold in the month of June. The Arabian name is Chaddajr.

PLACE.

VAR. C.

Le petit Guespier des Philippines, Brif. orn. iv. p. 555. No 10. f. z.

Description.

THIS is fix inches and a half long, and the same in plumage with the others, excepting that the streak on each side of the head, and the band on the throat, are blue: and the two middle tail feathers do not exceed the others in length, but are narrow the whole way, and black: indeed it is very probable, that the bird might have lost the two old feathers, and that these might have been two new ones not yet arrived at their sull growth; in which circumstance, this bird would be very little shorter than the first described, as the excess of length in that arose merely from the two middle feathers; both Linneus and Buffon have therefore set them down as varieties only.

YELLOW-HEADED B. Merops congener, Lin. Syst. i. p. 183. N° 3. Le Guespier à teste jaune, Bris. orn. iv. p. 557. N° 2. L'Istérocephale, ou le Guépier à tête jaune, Bus. ois. vi. p. 510. Merops alter, seu Meropi congener, Raii Syn. p. 49. N° 4. The other Bee-eater of Aldrovandus, Will. orn. p. 148.

DESCRIPTION.

THIS is a trifle bigger than the common Bee-eater. The head, throat, and all the under parts, are yellowish: on each side of the head is a broad black band, which begins at the base of the bill, and passes through the eyes towards the neck: back and scapulars fine chestnut: rump, and upper tail coverts, mixed green and yellow: lesser wing coverts blue; the middle ones mixed blue and yellow; and the greater ones entirely yellow: the quills are black.

black, tipped with red: tail half yellow, half green: the legs are yellow.

Said to inhabit various parts of Europe, but particularly PLACE. Strasburg, according to Gesner*.

cinereous:

cinereous; the webs of all of them brown above, and whitish beneath; the two middle ones are more than two inches longer than the others, and pointed: the legs are brown: the claws black.

PLACE,

Inhabits Madagascar, where the natives give it the name of Patirich Tirich.

Buffon also mentions another of this kind from Madagascar, of the same size and colours, but less distinct: the bill weaker, and the two middle tail seathers not longer than the others: the stripes on the sides of the head, and the rump and tail, sea green: but in another like it, brought by Sonnerat, the two middle tail feathers were a good deal longer than the others, which might arise either from age or sex.

This, or one very like it, is likewise mentioned by *Dr. Pallas*, which inhabits the banks of the *Caspian Sea*, making its nest in the crags thereabouts, but migrates afterwards.

PHILIPPINE B. Merops Philippinus, Lin. Syst. i. p. 183. N° 5.

Le grand Guespier des Philippines, Bris. orn. iv. p. 560. N° 12. pl. 43.
f. 1.—Pl. enl. 57.

Le Guépier vert à queue d'azur, Bus. ois. vi. p. 404.

DESCRIPTION.

THIS species is somewhat less than the common Bee-eater: length eight inches ten lines. Bill above two inches * in length, and black: the head, hind part of the neck, and upper parts of the body, dull green, with a copper gloss; but the rump

and

^{*} The gape of this bird is very wide, reaching much beyond the eyes, which makes the bill to have this length of measure.

and upper tail coverts are blue green: on each fide the head is a stripe of black, beginning at the upper mandible, and passing through the eyes: throat yellowish, shaded with green, and sulvous; the lower part of it most inclined to sulvous: the fore part of the neck, and under parts of the body, yellowish green, glossed with sulvous: under tail coverts pale blue green: the quills the same as the back, but sulvous within; many of them have blackish tips: tail of equal length; the two middle feathers are blue green; the others the same; but the inner edges cinereous: the shafts blackish above and white beneath: legs and claws brown.

Inhabits the Philippine Islands.

PLACE.

Merops cinereus, Lin. Syst. i. p. 183. N° 6. Le Guespier du Mexique, Bris. orn. iv. p. 541. N° 5. Le Guépier à tête grise, Bus. ois. vi. p. 491.

6. CINEREOUS B.

DESCRIPTION.

THIS is not bigger than a Lark: total length nine inches and a quarter. The bill is an inch and a half long, and of a bright green: the head is of an elegant grey: the upper parts of the body are grey, variegated with red and yellow: the under parts of a light yellow, shaded with red: quills grey: the two middle tail feathers, which are longer than the others, are red; the rest of them grey.

Said to inhabit Mexico.

PLACE.

YELLOW B. Le Guespier jaune, Bris. orn. iv. p. 539. N° 3. Le Guépier à tête jaune & blanche, Bus. ois. vi. p. 490. Manucodiata secunda Aldrovandi, Raii Syn. p. 21. N° 2. Aldrovandus's second Bird of Paradise, Will. orn. p. 91. t. 11.

DESCRIPTION.

THIS bird is a good deal bigger than the common Bee-eater; it expands twenty inches. It is remarkable for the length of the two middle tail feathers, and the proportionate shortness of its bill, which is of a yellowish green, two inches in length, and a little bent: the tongue long and pointed, like that of a Wood-pecker: the head white, variegated with yellow and gold-colour: the eyes yellow: eyelids red: the breast reddish: neck, belly, and under the wings, whitish: the back yellow: rump, tail, and wings, very bright rusous: the two middle tail feathers are eight inches * longer than the rest.

This is the description of Buffon, which pretty well agrees with that of Willughby. Aldrovandus adds, that it was in the hands of Seigner Cavalieri at Rome, who knew not from whence it came.

BRASILIAN B. Le Guespier du Bresil, Bris. orn. iv. p. 540. N° 4. Le Merops rouge & bleu, Bus. ois. vi. p. 479. Pica Brasiliensis, Seba. i. pl. 66. s. 1. figure inaccurate.

DESCRIPTION.

THIS is about the fize of the common Bee-eater: length nine inches. Bill one inch and a quarter, and yellow: the head, throat, and under parts of the body, are of a splendid, glowing,

* Willughby fays, two palms, which is only fix inches.

ruby

ruby red: the leffer wing coverts deep red: the rest of the wings, and upper parts of the body, varied with brown and black: under the wings yellow: quills and tail pale blue: legs and claws yellow.

Inhabits Brafil. Buffon observes, that the bill in Seba appears like that of the Promerops.

PLACE.

Le Guespier de L'Isle de France, Bris. orn. iv. p. 543. N° 6. pl. 44. f. 2. —Pl. enl. 252.

PLACE.

9. Var. A. Le Guépier marron & bleu du Senegal, Buf. ois. vi. p. 494. Guépier à longue queue du Sénégal, Pl. enl. 314.

Description.

THIS is a variety of the last from climate: it is twelve inches in length. The colours are the same, only somewhat different in the distribution: the chestnut extending in this to the wing coverts and quills, except those nearest the back; and to all the tail feathers, except the part which exceeds the rest in length, which is black.

PLACE.

This was brought from Senegal, by M. Adanson.

YELLOW-THROATED B.

Description.

Le grand Guépier vert & bleu à gorge jaune, Buf. ois. vi. p. 502.

HE length of this species is ten inches. The bill twenty lines: the forehead, the eyebrows, and all the under parts of the body, are blue green: the throat is of a fine yellow, which extends on the neck, under the eyes, and a little beyond, where it is terminated by brown: the upper part of the head and neck are bright golden red: all the upper parts of the body green gold: upper tail coverts green: the two middle tail feathers are longer than the others by seven or eight lines.

This, Buffon fays, is a new species, for which he is indebted to M. Sonnerat; but does not mention its native country.

Le Guespier d'Angola, Bris. orn. iv. p. 558. N° 11. pl. 44. f. 1. A. Le petit Guépier vert & bleu à queue étagée, Bus. ois. vi. p. 503.

ANGOLA:

HIS is five inches and a half long. The bill three quarters of an inch in length, and black: the irides red: the upper parts of the head, neck, body, and wings, are green, with a flight gloss of gold: on each fide of the head is an ash-coloured stripe, dotted with black, beginning at the base of the bill, and passing through the eye: the throat is yellow: fore part of the neck of an elegant chestnut: breast, belly, sides, and thighs, greenish blue, with a slight gold tinge: under tail coverts greenish, with a little mixture of chestnut: quills above green; within, and beneath, cinereous: the tail beneath cinereous; above green; the side feathers margined within with cinereous; it is different in shape from the other species, for it is wedge-shaped; each feather shortening as it is more outward, so that the last is very short: the legs are ash-colour: claws black.

DESCRIPTION.

Inhabits the kingdom of Angola, in Africa, from whence the drawing was fent to Briffon, by M. Le Poivre. This feems to have fome affinity to the last.

PLACE.

Guespier a tête rouge des Indes, Bris. orn. iv. p. 563, N° 13. pl. 44. f. 3. A. Le Guépier à tête rouge, Bus. ois. vi. p. 508.

RED-HEADED

THIS is a trifle bigger than the last; and the length six inches.

The bill is fixteen lines long, and black: the irides red: the head, and upper parts of the neck, are of a very fine red: on each side.

Description.

fide of the head is a black band, arifing at the base of the bill, and passing through the eyes: the back, rump, scapulars, and upper tail coverts, are of a fine green: the throat yellow: the fore part of the neck, breast, belly, sides, and thighs, yellowish, shaded with a little red: under tail coverts yellowish, edged with light green: under the wings deep green: the quills are of a deep green, edged with ash-colour; beneath entirely ash-colour: the tail feathers of equal lengths; beneath ash-colour, above green; all but the two middle ones are ash-colour on the inner margins: legs ash-colour: claws blackish.

PLACE.

Inhabits the East Indies. Described from a painting of M. Le Poivre.

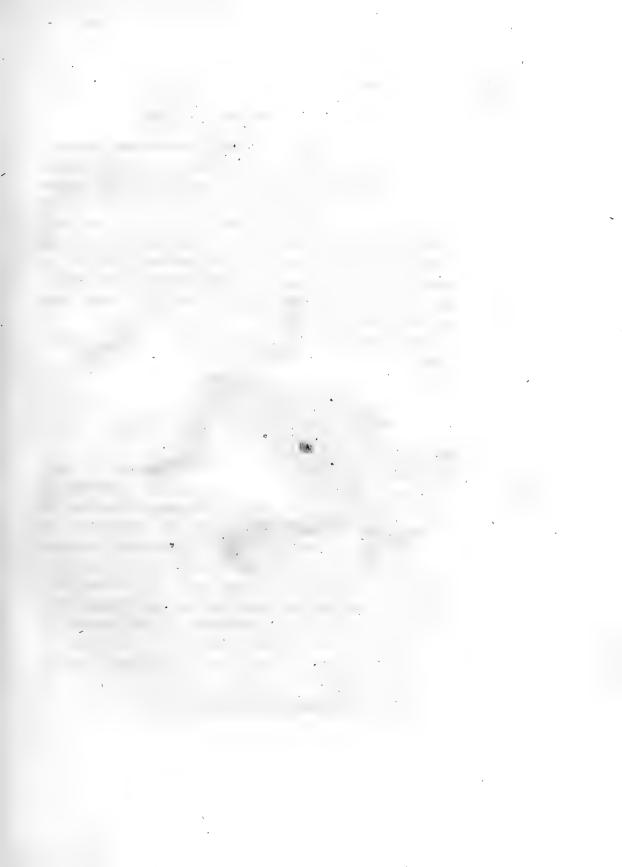

BLUE-HEADED B. Le Guépier rouge à tête bleue, Buf. ois. vi. p. 506. Guépier de Nubie, Pl. enl. 649.

DESCRIPTION.

THIS is fomewhat less than the common Bee-eater: the length ten inches. The bill an inch and three quarters, and black: the head and throat are of a blue green, deepest on the last: the rump and upper tail coverts of the same colour: the fore part of the neck, and beneath as far as the thighs, are crimfon, with a shade of rusous: the back, wings, and tail, brick-colour, inclining to brown on the wing coverts: three or sour of the quills nearest the body are greenish brown, with a tinge of blue; the greater quills tipped with blueish grey, blended with red: the secondaries tipped with blackish brown: the tail is somewhat sorked, and sour inches in length; the edges greenish: the legs are light ash-colour.

PLACE.

This inhabits Nubia, where it was figured by Mr. Bruce.

Red winged Bee - Eater.

Le Guépier rouge & vert du Senegal, Buf. ois. vi. p. 507. Petit Guépier du Senegal. Pl. enl. 318. RED-WINGED

B.
PL. XXXI.

DESCRIPTION

HE length of this species is six inches. The bill one inch, and black: the upper parts of the head, body, wings, and tail coverts, are green brown, deepest on the head and back, lightest on the rump and tail coverts: behind the eye is a spot of the same, but of a very deep colour: the quills and tail are red, tipped with black: the last two inches in length: the throat yellow: the under parts of the body dirty white: legs black.

This inhabits Senegal, from which place a well-preserved skin was brought by M. Adanson.

PLACE.

Le Guépier vert à ailes & queue rousses, Buf. oif. vi. p. 509. Guépier à queue & ailes rousses de Cayenne, Pl. enl. 454.

CAYENNE B.

HE bill is black: the body green, lightest on the under parts, but lightest of all on the throat: the wings and tail are rusous; the seathers of the first are white at their base; both these and the tail seathers are black at the sides; the last even at the end: the legs are yellowish brown, and longer than is usual in this genus.

This in the Pl. enl. was faid to come from Cayenne; but Buffon does not credit it, believing the whole of this genus belong to the old continent: but however this may be, I observe in Fermin Descr. de Surinam, two kinds of Bee-eaters mentioned, the one great, the other smaller, as follow:

Description.

682

16. SURINAM B.

Le Guépier, Fermin Descr. de Surin. vol. ii. p. 184.

DESCRIPTION.

HIS is the fize of a Blackbird; but refembles the Kingsfisher in shape: the irides red brown: the plumage is varied; behind the head it is reddish: the neck of a greenish yellow: the quills greenish, mixed with black and blue: claws black. He does not describe the second, or smaller kind; but says that they both feed on bees and other insects.

+ POË:

New Zeeland Creeper, Brown. Zool. illustr. p. 18. pl. 9. - Cook's Voy. i. p. 480-Lev. Mus.

DESCRIPTION.

SIZE fomewhat bigger than a Blackbird: length eleven inches. Bill an inch and a quarter long, bent, and black: infide of the mouth, and tongue, yellow; the last is black at the end, and furnished with several bristles: the general colour of the plumage is a deep greenish black, and in many parts very glossy: the seathers of the neck are loose and long; the webs of a loose texture, and somewhat curled, standing from the neck not unlike a ruff; each feather has a white streak down the shaft: on each side of the neck is a bunch of curled feathers, wholly white: the greater wing coverts are also white, forming a bar across the wing: the tail coverts of a rich blue: the tail of the same colour as the rest of the body, and even at the end: the legs are black: the outer toe joined to the middle by a membrane.

PLASE.

This inhabits New Zealand, where it goes by the name of Kogo; but is better known by that of Poë-bird. It is held

* Forf. Voy. vol. i. p. 519.

in

in great esteem and veneration by the natives*. Said to sing admirably well +.

Lev. Muf.

QIZE of a Lark: length, from bill to tail, fourteen inches. an inch and a half long, pretty much bent, and sharp at the tip; the nostrils covered with a membrane: tongue divided into threads at the end: the general colour of the plumage is gloffy black: the feathers about the head and throat short, and pointed: beneath each wing is a large tuft of yellow feathers, which do not appear when the wing is closed: on the vent is another patch of the fame colour: the tail is greatly cuneated; the two middle feathers are feven inches in length, and the outer ones only two inches; both the outer feathers are white on the outer webs and tips; the others black; the ends are pointed: the legs are black: the outer and middle toes connected to the first joint.

These birds were met with in great plenty at O-why-hee, and others of the Sandwich Ifles, by our late voyagers; at which place the natives catch the birds alive, and, after plucking out the yellow feathers, give them their liberty again, making use of the feathers in forming the various ornaments and dresses; great variety of the specimens of which are to be seen in the Leverian Museum.

> Le Fournier, Buf. oif. vi. p. 476. Fournier des Buenos Ayres, Pl. enl. 739.

THE length is eight inches and a half. The bill twelve or thirteen lines: the plumage in general rufous; deepest on

4- YELLOW-

DESCRIPTION.

PLACE.

the-

the upper parts of the body, and inclining to yellow beneath: the quills are brown, with the outer edges rufous: the wings, when folded, reach to within one inch of the end of the tail, which is three inches long: the toes are feparated to their origin: and the hind claw flouter than the others.

PLACE.

Inhabits Buenos Ayres. Buffon thinks this to be an intermediate fpecies between the Promerops and the Guepier, as it has not the outer toe joined to the middle almost the whole length, like the last; and yet it has the toes longer, and the tail shorter, than the Promerops:

MOLUCCA B. Le Polochion, Buf. oif. vi. p. 477. Lev. Mus.

DESCRIPTION.

HIS bird is about the fize of a Cuckow, and weighs five ounces: it is fourteen inches in length. The bill is very pointed, two inches long, notched near the tip; the colour blackish: nostrils near the middle of the bill, pervious, and covered with a membrane at the back part: the tongue is as long as the bill, terminated with a pencil of hairs: the eyes are surrounded with a naked skin: the cheeks are black: the hind part of the head mixed with white: the feathers of the forehead form an angle backwards: the tips of some of the throat feathers silky: the general colour of the plumage is grey, deepest on the upper parts, and lightest beneath: the tail is five inches and two-thirds in length, and consists of twelve feathers, all of which are equal, except the outer ones, which are a trisle shorter: the outer toe is united at the base to the middle one: and the hind claw is much larger than the others: colour of the legs dusky.

This ..

This bird inhabits the isle of *Bouro*, one of the *Moluccas*. It is called *Polochion* *, from its imitating the found of that word as its common and perpetual note, when perched on the high branches of trees.

PLACE.

* This, in the language of those islanders, signifies, kifs us.

Var. A. Yellow Pr.

HE characters of this genus are,
The bill long, flender, and bending.

Nostrils small, placed near the base.

Tongue short *, sagittal.

Toes placed three before, and one behind; the middle one connected at the base to the outmost.

Of the birds in this chapter, only the first species is sound in Europe; and in fact, only this and the second species properly belong to the Hoopve genus; yet, as the Promeropes of other authors seem to differ chiefly in being destitute of a crest, they may properly have a place here, according to the example of Linnæus. The manners of the first are pretty well known; but, as to the others, we know very little of them, more than the bare descriptions.

* I fear this character will not carry us through the whole of the species; for in N° 5, it is as long as the bill, and in N° 7, not much shorter. I have not feen the tongues of any other.

Br. Muf. Lev. Muf.

T CANNOT give a better description of this singular and beautiful bird, than in copying that of the British Zoology. "It weighs three ounces: its length is twelve inches: its breadth nineteen. The bill is black, two inches and a half long, slender, and incurvated: the tongue triangular, small, and placed low in the mouth: the irides are hazel: the creft confifts of a double row of feathers*, the highest about two inches long; the tips are black; their lower part of a pale orange-colour: the neck is of a pale reddish brown: the breast and belly white; but inyoung birds marked with narrow dufky lines, pointing down: the leffer coverts of the wings are of a light brown: the back, fcapulars, and wings, croffed with broad bars of white and black: the rump is white: the tail confifts of only ten feathers, white marked with black, in form of a crefcent, the horns pointing towards the end of the feathers: the legs are short, and black: the exterior toe is closely united at the bottom to the middle toe."

This bird inhabits not only Europe, but Asia and Africa like-

PLACES AND MANNERS.

Williaghby fays, they are twenty-four, or twenty-fix, in number. Orn:

wife...

DESCRIPTION.

wife. It is faid to be met with in the large forests of Sweden *, and in Austria +; and has been found as far north as the Orknies and Lapland, as well as in many of the intermediate places between them; also at the Cape of Good Hope on the one hand, and quite to Cevlon t and Java on the other. In Europe it is accounted a bird of passage, and is said not to winter even in Greece ||. In England it is far from common, being feen only now and then, and at uncertain times. Kent, Surrey, Northumberland, and Mostyn in Flintsbire, have been particularly noticed, though it has been met with also in other counties. It is a solitary bird, feldom two being feen together; though in Egypt it is faid to affemble in fmall troops. It is very common at Cairo, where it builds in the streets, on the terraces of the houses. In fome countries it is accounted good eating, though they do not think fo at the last-named place; perhaps, from its not feeding fo cleanly in the neighbourhood of cities, the flavour may not be fo good. This may be called a terrestrial bird, as it seldom perches on trees. It does not erect the creft, except being agitated by furprize, or the like; in a natural state the crest falling behind on the neck &.

FEMALE.

The female is like the male, and lays from two to feven eggs, but for the most part four or five. These are somewhat less than

^{*} Fauna Suecica, p. 37. + Scopoli. ‡ Edwards.

^{||} The Hoopee and Roller are said to come into Constantinople in August, from the north, to return in spring. Faun. Arab. p. 7.——" The Hopeee and Bee-eater come in the spring, and remain all the summer and autumn." Russel. Alep. p. 70.

[§] It is faid to spread the crest beautifully whenever it alights on the ground. Pococke.

those of a Partridge, but longer, and ash-coloured*. This bird is said to have two or three broods in a year, and to lay the eggs in the holes of trees, like the Woodpecker, but in general to make no nest: notwithstanding which, Buston observed, that two out of six nests, which were brought to him for inspection, had a soft lining of moss, wool, leaves, seathers, and the like; and he is of opinion, that when this is the case, the bird has made use of the old nest of some other bird. It will also lay, and hatch the young, in holes of walls, and even on the ground. The food of this bird is insects; and it is the exuviæ of the large beetles, and such like, with which the nest is crowded, that cause the nest to stink so horribly; insomuch that former authors afferted the nest to be made of excrement.

Olina fays, that the life of this bird is three years; perhaps he means in a confined state. Buffon mentions one of them, which lived with a lady for three months, substituting only on bread and cheese. This bird, contrary to the common opinion, drank frequently, and that by gulps. Another was kept for eighteen months on raw meat, and would not eat any thing else.

Some authors mention a variety of this species. Belon observes this, but does not give sufficient indications of the circumstances which occasion the variety. Kolben mentions one at the Cape of Good Hope +, which is smaller: the bill shorter in proportion: and the legs longer: the crest too is not so long, and has no trace of white in it throughout; and in general the plumage is less va-

VARIETIES!

^{*} Faun. Suecic. It is here remarked, that the note of the bird imitates the name which it is known by.

[†] Kolben Hist. du Cap. i. p. 152. I have seen one of these from the Cape; but it scarcely differed, except in being smaller.

riegated. Another specimen, from the same place, had the upper part of the back of a deep brown, and the belly varied with brown and white; but as this was less in every respect, it most likely was ayoung bird.

Besides these, Gerini* mentions one which he saw at Florence, and again on the Alps, which had the crest bordered with fky-blue.

MADAGASCAR H. La Huppe noire & blanche du Cap de Bonne Esperance, Buf. vi. p. 463.

La Huppe du Cap de Bonne Esperance, Pl. enl. 697.

DESCRIPTION.

Weight four ounces. The bill is twenty lines, bent, much pointed, and of a yellowish colour; the upper mandible notched near the tip; and the tongue divided at the end into several threads: the palate full of tuberosities: the crest is smaller in proportion than in the common Hoopoe, and tends to a point behind, like that of the Cuckow of Madagascar; the crest, throat, and under parts of the body, are plain white: and the upper parts, from the crest to the end of the tail, are brown in different shades: on the wings is a white spot; the tail consists of twelve feathers, contrary to the common one, which has but ten; and the two middle feathers rather shorter than the others: the legs and claws are yellowish; the hind claw large, and very crooked.

PLACES.

This bird, which differs confiderably from the former, as well as

CRESTED PROMEROPS

DESCRIPTION.

THIS bird is the fize of a Starling: the length nineteen inches, of which the tail is fourteen inches and a quarter. The bill is thirteen lines long, and of a lead-colour: the head, throat, and neck, are of a very fine black: the feathers of the crown are two inches in length, forming an elegant crest: the back, rump, scapulars, upper wing and tail coverts, quills, and tail, are of a pale chestnut: breast, belly, sides, thighs, and under tail coverts, pale ash-colour: the two middle tail feathers exceed the rest in length very much, being above sourceen inches long, whereas the others are not more than three inches: legs and claws lead-colour.

Inhabits the East Indies, where it is faid to be very scarce.

PLACE.

Le Promerops du Mexique, Bris. orn. ii. p. 463. N° 2. Le Promerops à ailes bleues, Bus. ois. vi. p. 467. Avis, Ani, Mexicana, caudâ longistimâ, Seba, i. p. 73. t. 45. f. 3.

MEXICAN PR.

THIS is about the fize of a Song-thrush: length eighteen inches and three quarters: the tail twelve inches and a quarter.

Description.

* Supposed to be that mentioned by Flacourt, in his History of Madagascar, by the name of Livouch.

4. T. 2

The

HOOPOE.

The bill is an inch and eight lines long, and blackish; but the fides are yellowish: the head, throat, neck, back, and rump, are dull grey, glossed with sea-green and purplish red in different lights: belly, sides, thighs, and under tail coverts, light yellow: above each eye is a spot of the same: the greater quills are light blue; but the lesser the same colour as the back: the tail is blackish grey, but in some lights has a gloss of deep green and purple; four of the middle ones are much longer than the others.

PLACE.

It is faid to inhabit Mexico, and to frequent high mountainous places, where it feeds on caterpillars, flies, beetles, and other infects. Buffon feems to suspect the fact of this being a native of South America.

Lev. Mus.

Description.

THE length of this species is seventeen inches: the body about the fize of a Lark. The bill is an inch and five lines long, and black: the upper parts of the head, neck, back, wing coverts, and scapulars, are brown: rump and upper tail coverts olive green; but under the tail of a fine yellow: the throat is white, with a narrow longitudinal brown band on each side: the fore

fore part of the neck and breast incline to rusous: the belly white: thighs brown: the seathers on the sides the same, but edged with white: quills brown: the tail is composed of twelve feathers of the same colour; the six middle ones are twelve inches and a quarter in length, the others much shorter; the outer one being two, the next three, and the third sour inches only in length: the legs and claws are black.

This is the description of Brisson; but appears to be the female, or a young bird, since the under parts are very sparingly spotted, and that only on the sides; whereas, in many specimens, they are manifest, both on the breast and belly, which Busson thinks to be the male; the tail feathers of which, he says, are one inch longer than the female, and has a narrow stripe of grey across the wings. I think it not amiss to add, that the feathers on the sorehead and crown are narrow, pointed, and mixed with greyish: and the tongue reaches quite to the end of the bill.

These birds are very common at the Cape of Good Hope, from which they are frequently brought, and may be found in many collections.

With the above I have ventured to place the *Merops cafer* of *Linnæus*, as fynonymous. This last he has given a very imperfect description of, and that merely from a drawing: the whole which he says of it is, that it is of a grey colour, has a yellow vent, and a very long tail, and inhabits Æthiopia.

That likewise mentioned by M. Koelreuter, in the Petersburgh Transactions, I am not quite clear in: he calls it Merops caser, the one above alluded to; but his description leads one to think it the Promerops above described.

PLACE.

6. NEW GUINEA BROWN PR. Le Promerops brun de la Nouvelle Guinée, Son. Voy. 164. t. 1002. Le Promerops brun à ventre rayé, Buf. oif. vi. p. 471. pl. 22. Promerops de la Nouvelle Guinée, Pl. enl. 638.

Description.

Male.

HIS measures twenty-two inches from the end of the bill to that of the tail. The bill is two inches and a half long, pretty much bent, and of a shining black colour: the irides are black: the top of the head *, and fides, are of the colour of polished steel: the neck and throat are black: the hind part of the neck, the back and wings, scapulars, and tail, are brown: the three first are tinged with brownish green, and the colour of the three last paler, except the outer tail feather, which is black on the inner web the whole length: the breast and under parts of the body are transversely striped with black and white, each featherhaving two black and two white bars on it, with the base grey: the wings, when closed, reach four inches beyond the origin of the tail, which confifts of twelve feathers; the middle ones of which are thirteen inches long, the others growing shorter by degrees, the fhortest being only four inches: the legs are: black.

FEMALE.

In the *female* the head and neck are brown, but otherwise like the male.

PL ACE.

Inhabits New Guinea.

^{*} That in the Pl. enl. has a tinge of rufous on the head; but this must be esteemed a variety.

Grand Promerceps.

Le grand Promerops de la Nouvelle Guinée, Son. Voy. p. 166. pl. 101.— Pl. enl. 639.

Le grand Promerops à paremens frisés, Buf. vif. vi. p. 472.

GRAND PR. PL. XXXII.

DESCRIPTION.

THIS most extraordinary and beautiful bird is near four feet in length, from the tip of the bill to the end of the tail: the body is the fize only of a middling Pigeon, though much elongated in shape. The bill is three inches long, pretty much-curved, and black: the head, hind part of the neck, and upper part of the belly, are of a shining green: the rest of the plumage, on the upper parts, black, mixed with a gloss of changeable violet, but the wings, in some lights, appear blue: the fore part of the neck, and lower part of the belly, without gloss: the scapular feathers are of a fingular construction; the webs on one side of the shafe being exceeding short, and on the other of a great length; the shape of them falciform; they are of a purplish black colour, with the ends for three quarters of an inch of a most brilliant gilded gloffy green, though fome of them, in a different light, reflect a blue gloss: beneath each wing arises a thick tust of feathers, eight inches and a half in length, and of a texture refembling the herring-bone ones in the greater Bird of Paradise; and, besides these, on each fide of the tail are five or six falciform feathers, with unequal webs, as the fcapulars, though not half fo much curved; the colour half dusky half greenish brown; the last divided from the other colour, on each feather, in an oblique manner: the tail confifts of twelve feathers, and is of an enormous length, the middle ones measuring no less than twenty-eight inches; but each of the others shortens as it proceeds outwards, to the outer one of all, which is only five inches in length; the -colour colour of all of them is blue black, with a polished steel gloss in some lights: the legs are black.

OBSERVATIONS.

Such is the description of a specimen in the possession of Miss Blomefield, of which I have hazarded the position of the feathers, as represented in the adjoining plate. The bird, on her first receipt of it, had been manifestly distorted to a great degree, almost every feather being twifted out of its place; though the bird itself was more perfect than that mentioned by Sonnerat, or the one figured in the Planches eluminées, neither of these having any of the tusted feathers, which, in the adjoining plate, hang over the thighs. Sonnerat, indeed, talks of two fets of feathers, one that takes rife above the wings, and the other from beneath them; but does not mention the loofe herring-bone ones fo conspicuous in the bird which I have described from: and the Planches enluminées is destitute both of the last, as well as those which hang on each side of the It is to be hoped that future connoisseurs in matters of this kind will not omit fetting us to rights, whenever it may be their good fortune to meet with this bird alive; for in this, as well as the whole of the Paradise Birds, conjecture must supply fome defects; as the natives act with this species as with those, by throwing away what by them are esteemed the useless parts, and fo transposing the several remaining ones, as to make the beautiful remnant appear to the best advantage, as a mere ornament, for as. fuch only it is valued by them.

PLACE.

This species inhabits New Guinea.

Le Promerops des Barbades, Brif. orn. ii. p. 466. N° 4.

orangé, Buf. oif. vi. p. 474.

Avis Paradifiaca, Americana, elegantissima, Seba, i. p. 102. t. 66. f. 5.

ORANGE PR.

THIS is the fize of a Starling: length nine inches and a half. The bill is thirteen lines long, very pointed, and of a gold colour: the base of the bill is surrounded with a few red seathers: the head and neck gold-colour: the rest of the body orange yellow: the greater quills are reddish orange; the lesser ones of the same colour as the body: the tail is three inches and three quarters long, the seathers all equal in length, and of the same colour as the greater quills: the legs yellow.

Description.

This is faid, by Briffon, to come from Barbadoes *.

PLACE.

Le Promerops jaune du Mexique, Bris. orn. ii. p. 467. N° 5. Le Promerops orangé (the female), Bus. ois. vi. p. 474. Cochitolotl, Raii Syn. p. 168.—Fernand. Hist. N. Hisp. ch. 161.

VAR. A. YELLOW PR.

THIS is of the fame fize with the last. The bill is black: the irides pale yellow: the head, throat, neck, and wings, are covered with an irregular mixture of cinereous and black: the rest of the bird is yellow: the legs are ash-colour: and the claws black.

DESCRIPTION.
FEMALE.

This inhabits the hotter parts of *Mexico*, where it feeds on small worms and feeds.

PLACE.

Buffon, with great probability, supposes this to be the female of the other.

* This bird, Buffon fays, is found in the northern parts of Guiana, in the small islands situated in the mouth of the river Berbice; and it seems manifest that Seba meant this very spot, since his words are, "in Insulis Berbicensibus," which clearly means Berbice, rather than Barbadoes.

HE bill in this genus is slender, incurvated, and sharp-pointed.

Nostrils small *.

Tongue in shape uncertain.

Legs moderately stout.

Toes placed three before and one behind; back toe large: claws hooked and long.

Tail confifting of twelve feathers.

This genus has, by many naturalists, been confounded with the following; but a little consideration will point out the difference. In the first place, Greepers are not confined to any climate, being found in all quarters of the globe; while Humming-Birds are met with only in the warmer parts of America. Secondly, The genus here treated of, has the bill pointed at the end, be the shape of it however different; but that of the Humming-Bird is bluntish. Thirdly, The Greeper genus feeds principally on insects; while the Humming-Bird's food consists only of the juice extracted from the

[•] In general they are so, but several of this genus are pretty large, and covered with a membrane.

nectaria of flowers. Less consequential differences might be likewise added, were it necessary.

The shape of the tongue, in birds of the Creeper kind, is various; in some of them it is short and pointed, and such birds may be supposed to feed wholly on insects; in others it is longer, and stated at the point: in several it is ciliated, or surnished with minute hairs on the sides; and again, in not a sew, it appears to be tubular, and bissid at the end, exactly like the same organ in Humming-Birds; those so provided, no doubt, enjoy a double method of surnishing themselves with food, the one by means of the bill, as in other birds; the other by extracting boney from Flowers; and are, no doubt, of a middle nature between the present and next genus: these perhaps will, by some future systematist, be thrown into a genus by themselves; but this can by no means happen till they are fully known.

It is very possible that many of the following, which are now described as *species*, will be found hereafter to be mere varieties; which is no wonder, as we are well assured that many *Creepers* do not gain their full plumage till the third year's moult.

Creeper, Br. Zool. No 91. t. 39 - Amer. Zool. No Br. Mus. Lev. Mus.

THIS bird is scarce bigger than the crested Wren: it weighs five drams: and is in length five inches and a half. The bill is hooked like a sickle; the upper mandible brown, the lower whitish: the irides hazel: the head, and upper part of the neck, are brown, streaked with black: rump tawny: the wing coverts variegated with brown and black: quills dusky, tipped with white, and edged and barred with tawny marks: the breast and belly are of a silvery white: the tail is very long, and consists of twelve stiff feathers*; they are of a tawny hue, and the interior ends of each slope off to a point: legs and claws grey.

This bird is found in most parts of Europe, though it is believed no where so common as in England. It may be thought more scarce than it really is, by the less attentive observer; for, supposing it on the body or branch of any tree, the moment it observes any one, it gets to the opposite side, and so on, let a person walk round the tree ever so often: the facility of its running on the bark of a tree, in all directions, is wonderful, doing this with as much ease

DESCRIPTION.

PLACE:

^{*} Willigbby, and some others, give it but ten-

as a fly on a glass window. Its food is principally, if not wholly, insects, which it finds in the chinks, and among the moss, of trees. It builds its nest in some hole of a tree, and lays generally five eggs, very rarely more than seven *; these are ash-coloured, marked at the end with spots and streaks of a deeper colour; and the shell is observed to be pretty hard.

It remains in the places which it frequents during the winter, and builds its neft early in the spring.

VAR. A.

Le grand Grimpereau, Brif. orn. iii. p. 607.—Buf. oif. v. p. 486. Gran-Specht, Frisch. t. 39.

DESCRIPTION.

THIS bird differs merely in fize from the other, being bigger: those who have seen it, aver that the manners are alike, except in one circumstance; for Klein + says, that it is so tame as to suffer him to catch it with the hand as it was running up a tree.

GREEN CR. Certhia viridis, Scop. ann. i. p. 52. Nº 60.

THIS, fays Scopoli, is the fize of the last nearly: a blue stripe runs from the base of the bill, and descends down the neck on each side: a rusous spot on the throat: the plumage on the upper parts of the body is greenish; on the under pale yellow, mixed

* Albin, and other authors, say as far as twenty; but Buffon denies this from his own observations; how it would be if the eggs were taken away, as mischievous boys sometimes serve the innocent Wren, I know not; perhaps it might in that case continue to lay on till its stock was exhausted.

and tail dusky; the last even at the end, and edged with yellow green: legs dusky brown; the seathers just above the knee, or garter, white: the hind toe pretty long.

PLACE.

Inhabits the Sandwich Islands in general, and is one of the birds whose plumage the natives make use of in constructing their feathered garments; which, having these olive green feathers intermixed with the beautiful scarlet and yellow ones belonging to the next species, and yellow-tusted Bee-eater*, make some of the most beautiful coverings of these islanders.

+ HOOK-BILLED RED CR.

Lev. Mus.

Description.

ENGTH fix inches. Bill three quarters of an inch long, and very hooked, though not so much as in the last species; the colour of it very pale: general colour of the plumage scarlet: wings and tail black: on the wing coverts next the body is a white spot, owing to two or three of the feathers having the outer webs of that colour: legs pale like the bill.

WARIETY.

In fome birds the forehead is of a buff-colour: and the parts about the head and neck have both a mixture of buff and dufky black, which are suspected to be the birds not yet arrived at their full plumage.

PLACE.

This beautiful species inhabits the Sandwich Islands, and is made great use of by the natives, in their feathered dresses; more of which will be said, when the account of the last expedition to those parts shall make its appearance.

Br. Muf.

6.-SICKLE-BILLED CR.

ENGTH five inches and a half. Bill an inch and three quarters in length, curved like a fickle, and of a dusky colour: the upper parts of the head, neck, and body, are green: on the head a gloss of violet: beneath, as far as the breast, violet: tail of this last colour: the great coverts and quills are pale brown: belly and vent pale brown: legs the same: claws black.

Description.

Male.

This is in the British Museum; but from whence unknown.

white: quills brown, edged with gloffy copper: tail blackiff; the outer feather tipped with white: legs and claws brown.

The bird from which *Edwards* drew his figure had a label tied to it, by the name of *Honey-thief* *.`

VAR. B.

Grimpereau troisieme de l'Isse de Luçon, Son. Voy. p. 63. t. 30. D. Soui-manga à gorge violette & poitrine rouge, Buf. oif. v. p. 499.

Description.

M. SONNERAT describes this in the following manner: The head is of a pale green: the throat glossy violet: breast of a red colour, between vermilion and carmine: back and wing coverts reddish chestnut: quills black: rump and tail the colour of polished steel, with a gloss of green: under tail coverts dull green.

This and the last but one appear to be varieties of each other; and *Busson* supposes that of *Edwards* to be the same bird likewise, not yet come to its colour. What leads him the more to think so is, that all of them are indigenous to the *Philippine Isles*.

That they are fond of honey is manifest, from those who keep birds at the Cape of Good Hope having many sorts in large cages, and supplying them with only honey and water; but besides this, they catch a great many slies, which come within the reach of their confinement; and these two make up their whole sub-sistence; indeed, it has been attempted to transport them surther, but the want of slies on board a ship prevented them living more than three weeks; so necessary are insects to their subsistence. Hist. des ois. v. p. 494.

Certhia Senegalenfis, Lin. Syst. i. p. 186. No 14.

SENEGAL CR.

Le Soui-manga violet à poitrine rouge, Buf. ois. v. p. 500.

THIS is a little bigger than a Wren: length five inches. Bill ten lines in length, and black: the top of the head and the throat are green gold, gloffed with copper: the rest of the body, above and beneath, are of a violet black: fore part of the neck and breast of a bright red: but this is only when the plumage lays smooth; for, on observation, each feather of the last-named parts is black at the bottom, then green gold, and the end only red: the thighs are violet brown: greater wing coverts, quills, and tail, brown: legs and claws blackish.

DESCRIPTION.

Inhabits Senegal.

PLACE.

Certhia chalybea, Lin. Syst. i. p. 186. No 10. Le Grimpereau à collier du Cap de Bonne Esperance, Bris. orn. iii. p. 643. C pl. 32. f. 1.

COLLARED CR.

Le Soui-manga à collier, Buf. oif. v. p. 502. Grimpereau du Cap de Bonne Esperance, Pl. enl. 246. f. 3. Purple Indian Creepers, Edw. 265.

ENGTH four inches and a half. Bill ten lines long, and blackish: the head, neck, throat, and upper parts of the body, are green gold, bronzed with copper; except the upper tail coverts, which are simply green gold: the breast of a beautiful red; this colour is separated from the green of the neck by a steel blue band, in some lights appearing green, and making as it were

DESCRIPTION ..

a collar :

CREEPER.

a collar: the belly, fides, thighs, and under tail coverts, are grey, with a little mixture of yellowish on the lower part of the breast and fides: quills grey brown: tail of a shining blackish colour; the ten middle feathers have the outer margin green gold, bronzed with copper, and outer one margined with grey; all of them are tipped with grey: legs and claws black.

FEMALE.

The female differs from the male, merely in having yellow fpots on the fides, according to Briffon*; others give it a red band like the male, but placed lower on the breaft, and all the other colours less lively.

VARIETY.

Buffon mentions one seen at the Cape of Good Hope by M. le Vicomte de Querokënt, which had the throat grey brown, mixed with green and blue: on the breast was a band of a fire-colour: the head and upper parts of the body mixed with green on the back, and towards the tail with blue: wings light brown above; beneath gilded yellow: tail feathers blackish: bill and legs black.

This gentleman adds, that it fang very prettily; that it lived on *infects*, and the *nectar* of *flowers*; but, in respect to the first part of its food, the throat of the bird was so narrow that it could not swallow the ordinary sorts of slies, if at all above the common size.

Buffon feems to think this last bird a young one of the last menmentioned, not come to its full plumage; and that the true female may turn out to be the following:

* Orn. vol. vi. fup. p. 117.

Certhia Capensis, Lin. Syst. i. p. 185. No 4. Le Grimpereau du Cap de Bonne Esperance, Bris. orn. iii. p. 618. pl. 31. CAPE CR.

THIS equals a Wren in fize: length four inches two lines. Bill three quarters of an inch, and blackish: the head, neck, and body, are grey brown; palest beneath: greater wing coverts brown, margined with grey brown: tail blackish; the outer edges grey brown, but the outer feather fringed with whitish on the outer edge: legs black.

Description.

Inhabits the Cape of Good Hope. Brisson thinks it the female of some one of this species, since the colours are very little vivid: perhaps, then, it may be the other sex of the last, as it comes from the same place.

PLACE.

Certhia Philippina, Lin. Syst. i. p. 187. No 21. Le Grimpereau des Philippines, Bris. orn. iii. p. 613. No 4. pl. 30. f. 2. —Pl. enl. 576. 1.

PHILIPPINE CR.

Grimpereau second de l'Isle de Luçon, Son. Voy. pl. 30. B?

PRISSON describes it as being less than our Creeper: length four inches and three quarters. Bill an inch in length, and black: tongue tubular, and forked: all the upper parts are grey brown, with a greenish cast; those beneath of a yellowish white: quills brown, with paler edges: the two middle tail feathers black, with a green gold gloss; the others blackish, tipped more or less with white, as they are placed more outwardly: legs

Description.

Linnæus

and claws black.

712

Linnaus gives it two very long feathers in the tail; but as the figure he quotes in Brisson has them not, it is most likely he had some reason for afferting this, though he does not mention any.

PLACE.

Inhabits the *Philippine Isles*, and particularly *Luzonia*, if it be the species alluded to by *M. Sonnerat*.

On a supposition that the Creepers of the old world are as long in gaining their sull plumage as those of the new, Buffon thinks it not improbable to suppose, that the five last mentioned are all varieties, or sexual differences of each other: but as this cannot be clearly ascertained as yet, I think better to let them stand as they do, on the authority of their describers, till time, the clearer up of all doubts, shall evince the contrary.

Le Soui-manga olive à gorge pourpre, Bust. ois. v. p. 506.

Grimpereau premier de l'Isle de Luçon, Son. Voy. pl. 30. A.

DESCRIPTION.

SIZE of a Wren: length four inches. Bill three quarters of an inch, and black: the upper parts of the body are of a dull brownish olive: the under parts yellow: but the throat, fore part of the neck, and breast, are of a beautiful bright deep violet: the quills brown: the edges of the seathers dull olive: the tail the same colour as the wings: legs and claws black.

PLACE.

Inhabits the Philippine Isles.

Br. Muf.

VAR. A.

ENGTH four inches and a half. Bill more than half an inch, and bent, the base white, tip black: top of the head and sides, to beneath the eyes, green: chin, neck, breast, back, and wings, brown: lesser wing coverts green: rump reddish purple: lower part of the breast and belly white: tail black: legs brown.

Description.

A specimen of this is in the British Museum.

PLACE.

Certhia olivacea, Lin. Syst. i. p. 185. N° 5. Le Grimpereau olive de Madagascar, Bris. orn. iii. p. 625. N° 11. Soui-manga olive à gorge pourpre, Bus. ois. v. p. 507. semelle? Grimpereau olive de Madagascar, Pl. enl. 575. f. 1?

OLIVE

ESS than our Creeper: total length four inches. Bill above half an inch long, and black: colour of the upper parts, from the forehead to the rump, dull olive-green, inclining to brown on the forehead and crown: the under parts grey brown: round the eyes whitish: quills and tail brown, with a tinge of elive-green; the two outer feathers white at the ends: legs pale brown.

DESCRIPTION.

Inhabits Madagascar. This furely can be no other than the serale of the last, though two circumstances join to forbid it, viz. the bill being shorter by one-third, and the tail much longer; in this last species it being nineteen lines in length, and in the former only sourteen, according to Brisson, whom I should not do justice to, in supposing him to fail of his usual exactness: however, I cannot venture at present to place it otherwise than as a distinct species.

—Buf ois. v. p. 508.—Pl. enl. p. 576. f. z.

Description.

ENGTH four inches and eight lines. Bill three quarters of an inch long, and black: tongue forked: the upper parts of the body are grey brown: the under parts yellowish white, deepest on the breast: down the middle of the neck, as far as the breast, is a deep violet stripe, beginning at the chin: the upper wing coverts are violet, with a steely glos: the quills brown: tail one inch and a quarter in length, and black, edged with steely blue, and whitish at the tips: legs and claws black.

PLACE.

Inhabits the Philippine Isles.

15. VAR. A. Certhia jugularis, Lin. Syst. i. p. 185. N° 7. Le petit Grimpereau des Philippines, Bris. orn. iii. p. 616. N° 6. pl. 33. f. 5.—Bust. ois. v. p. 509.—Pl. enl. 576. f. 3.

DESCRIPTION.

THIS is smaller than the last: length three inches and eighter lines. Bill three quarters of an inch, and blackish: the plumage above is grey brown; beneath yellow: on the throat is as pretty large spot of a deep violet-colour: quills grey brown: tail deep brown; the two outer feathers are obliquely tipped with yellowish white: legs and claws blackish.

BLACE AND OBSERVATIONS.

Inhabits the *Philippine Isles*. I think there can scarce remain a doubt of its being a *female*, rather than a *young one* of the last species. We generally observe, that the *females* are less vivid in their markings, if the same; or, if not, to have the marks not so well

well defined, as the male: and again, the outer tail feathers are tipped with white; this will be found in many of the females of both Humming-bird and Creeper genus, and will fomewhat affift in defining the fex, though I will not fay always a certain criterion.

Buffon has included the four last described in one chapter; shewing his opinion of the probability of all of them being nearly related to one another.

16. LOTEN'S CR.

fourteen lines, and black: the tongue compressed at the end*: the head, neck, back rump, scapulars, and upper tail coverts, are green gold: between the bill and eye, on each side, is a narrow line of velvet black: beneath, from the breast to the vent, of the last colour, which is separated from the green on the neck by a transverse bright violet band, a line and half in breadth: the lesser wing coverts are of this last colour; the middle coverts are green gold; and the greater coverts are very fine black, edged with green gold on the outer edge: the quills are the same colour; as are the tail feathers: legs black.

DESCRIPTION.

The female differs in having the breast, belly, sides, thighs, under wing and tail coverts, of a dirty white, spotted with black; and the wings and tail not of so fine a black.

FEMALE.

* Pl.-snl. 4 Y 2

M. Adanson

M. Adanson says, that the female, of which he has seen many at Senegal, is exactly like the male; and that the one described by Brisson as a female, is only a young bird not yet come to perfection.

Linnaus describes this very differently, though I am confident that he means the same bird. He says, the bill is twice as long as the head: the head and back shining blue: breast blue black, glossy, with a fire-coloured or golden ferruginous band on the breast: belly brown: quills black: tail the same, and even at the ends.

PLACES.

Inhabits Ceylon, and Madagascar; and is called Angala-dian.

Buffon tells us, that it makes its neft of the down of plants, in form of a cup, like that of a Chaffinch, the female laying generally five or fix eggs; and that it is fometimes chafed by a Spider as large as itself, and very voracious, which seizes on the whole brood, and sucks the blood of the young birds.

GREEN-GOLD CR. Le Soui-manga des toutes couleurs, Buf. oif. v. p. 513. Avis Ceylonica omnicolor, Seba, Thef. pl. 69. f. 5. Falcinellus omnicolor Zeylanicus, Klein. ord. av. p. 107. N° 8.

DESCRIPTION.

HE fynonyms of Seba and Klein are added, both by Linneus and Brisson, to the former; but it is plain that Seba could not mean the same bird: for his description says, it is near eight inches in length: the bill an inch and a half long: and the tail two inches and a quarter: the whole plumage green, with a shade of all manner of colours, among which that of gold bears the greatest share. Seba, indeed, adds, that the young of this falls a prey to the great Spider above mentioned *; but this

mishap

^{*} Merian mentions this of the young of Humming-birds in general.

mishap is surely not peculiar to this species merely; and I make no doubt, that not only this, but the young brood of every small bird, may be liable to the same accident, whenever this insect may be strong enough to gain the superiority; besides, the manifest difference in length, between sive inches and a half and eight inches, must, to every impartial judge, prevent them being ranked together as the same species.

Certhia afra, Lin. Syst. i. p. 186. Nº 11. Le Soui-manga vert à gorge rouge, Bus. ois. v. p. 514. Red-breasted green Creeper, Edw. glean. pl. 347. AFRICAN CR.

Description.

HIS is between four and five inches long. The bill is one inch, and dusky: head, neck, back, and wing coverts, shining green, glossed with burnished gold and copper: across the breast a bar of fine red: the upper tail coverts fine blue: greater wing feathers, and tail, dark brown; lighter on the edges: insides of the wings, and under side of the tail, lighter than above: belly, thighs, and under tail coverts, white: legs black.

This is met with at the Cape of Good Hope, where it is faid to fing as well as a Nightingale, and has a sweeter voice.

PLACE.

IN my collection is a bird which I should suppose to be of a different sex from the above, as it answers pretty well in all things except the belly, which is ash-coloured instead of white, and is probably the very bird which Edwards has described; with this addition, that in my specimen there is a tust of sine yellow seathers under each wing, and the tongue bisid at the end. It

18. + VAR. A.

DESCRIPTION.

most

most likely merely differs in sex from that mentioned by Lin-neus and Buffon, in which the belly was white.

PLACE.

I received this specimen from the Cape of Good Hope.

18. Var. B.

DESCRIPTION.

In the collection of Miss Blomefield, I observed a further variety, which answered, in all respects, to my bird, except in having the fore parts of the neck, from the chin to the breast, of a glossy purplish blue, and the bar on the breast of a deep red, inclining to purple,

From whence this bird was received is uncertain.

Le grand Soui-manga vert à longue queue, Buf. oif. v. p. 521. Grimpereau à longue queue du Cap de Bonne Esperance, Pl. enl. 83. f. 1.

Description.

SIZE of a Linnet: length nine inches. Bill fifteen lines and a half, and black: tongue the length of the bill: the whole plumage is green-gold, with a gloss of copper: between the bill and eyes is a stripe of black like velvet *: on each side, under the shoulders, is a fine yellow spot, which does not appear unless the wing is lifted up: greater wing coverts and quills blackish, edged with green: tail of a bright black; the two middle feathers are two inches and a half longer than the others, and are edged with gold and copper green on both sides; the side feathers are green only on the outer edges: legs and claws are black.

FEMALE.

The female has the head and upper part of the body of a greenish brown, with a mixture of fine green: the rump green: the quills and tail black brown: beneath the body is yellowish, with a mixture of green feathers on the breast: the tail is long, as in the male, but the two middle feathers exceed the side feathers by only two inches and some lines; these long feathers are likewise very narrow, as it were only a thread.

^{*} In the Planches eluminées this is omitted.

The above circumstances we are furnished with by M. le Vicomte Querobënt, who has made proper observations thereon, having kept these birds at the Cape of Good Hope, of which they are natives, for some weeks.

PLACE.

+ CINEREOUS CR.

DESCRIPTION.

LENGTH nine inches. Bill one inch and a half long, shaped as in the former: tongue as long as the bill: head, neck, upper part of the back, and breast, brownish ash-colour: on each side of the lower jaw a yellowish streak: lower part of the back, and rump, glossy green: wing coverts the same: quills brown: belly pale yellow: down the middle of the breast and belly a mixture of glossy green: vent white: tail black; the two middle seathers two inches and a quarter longer than the rest, the others cuneiform: legs black.

From the Cape of Good Hope. This feems, in some things, to coincide with the female of the last mentioned.

PLACE.

Trochilus coccineus, Lin. Syst. ed. 6. p. Le Grimpereau rouge du Mexique, Bris. orn. iii. p. 651. N° 24. L'Oiseau rouge à bec de Grimpereau, Bus. ois. v. p. 522. Avicula Mexicana, seu Hoitzillin, Seba, vol. i. p. 70. N° 6.

RED CR.

IT is bigger than our Creeper: and is four inches and a half nearly in length. The bill is ten lines long, and of a light yellow: the upper part of the head is of a light but bright shining red: the throat, and fore part of the neck, green: the whole of the upper parts of the body, and the under tail coverts, are

4Z

DESCRIPTION.

deep

deep red: the quills are the same, with blueish tips: thighs of a light yellow: tail deep red: legs and claws light yellow.

PHACE.

Supposed to be found in *Mexico*; but *Buffon* wishes this circumstance may be held in doubt, till further observation may confirm it, as he thinks, from the length of bill, it is more likely to prove a native of the old continent, as well as the three following.

It is faid to have a very agreeable voice.

Certhia of Guiana, Bancr. Guian. p. 164?

Lev. Muf.

THIS is somewhat bigger than our Creeper: length sour inches. Bill nine lines long, and black: the head is of a most elegant blue; but on each side there is a stripe of black like velvet, in which the eye is placed: the chin and throat are marked with black in the same manner: the rest of the body violet blue: the upper and under wing coverts, quills, and tail, are black: legs yellow: claws black.

Brisson mentions each feather of the blue plumage having a brown base, then green, with the tip only blue; which circumstance likewise is observable in the last species.

Inhabits Cayenne. Seba* fays, that it makes its neft with great art; the outfide is composed of dry stalks of grass, or such-like, but within of very downy, soft materials, in the shape of a retort, which it suspends from some weak twig, at the end of a branch of a tree; the opening or mouth downwards, facing the ground; the neck is a foot in length, but the real nest is quite at the top, so that the bird has to climb up this sunnel-like opening to get at the nest: thus it is secure from every harm, neither Monkey, Snake,

D'ESCRIPTION.

PLACE.

nor Lizard daring to venture at the end of the branch, as it would not steadily support them *.

Mr. Bancroft mentions a Certhia found in Guiana †, having an arched, slender, and somewhat triangular bill, with a pointed tongue; its colour blue, but the wings and tail black, and the tail of an unusual length: whether this has any relation to the species abovementioned, cannot be determined from so short a description; but it is not impossible that it may prove the male of the last.

BLACK-HEADED CR. Certhia spiza, Lin. Syst. i. p. 186. No 12. Le Grimpereau à teste noire d'Amérique, Bris. orz. iii. p. 634. No 16. Le Guit-guit vert & bleu à tête noire, Bus. ois. v. p. 534. Avicula Americana altera, Seba, ii. t. 3. f. 4. Lev. Mus.

DESCRIPTION.

A BOUT the fize of a Chaffinch: length five inches and a quarter. Bill three quarters of an inch, and of a whitish colours the head and throat are of a velvet black: hind part of the neck, back, rump, scapulars, upper wing and tail coverts, and quills, fine green: fore part of the neck, breast, belly, sides, and under tail coverts, blue: tail deep green.

PLACE.

Inhabits America.

^{*} I do not know any author who has figured this particular nest in his works; but a very good idea may be formed by consulting Bris. orn. vol. iii. pl. 18. Will. orn. pl. 77; where such kinds of artificial nests, built by other kinds of birds, are given.

DESCRIPTION.

SIZE of our Creeper: length four inches two lines. Bill nine lines, and black: the upper part of the head and neck, the back and rump, are of a fine palish green: scapulars, upper wing and tail coverts,

coverts, the fame: throat rufous; and between the nostrils and the eye a very small spot of the same: along the lower jaw, on each fide, is a narrow band of blue: the cheeks are white, each feather margined on both fides with green: the under parts of the body are of the fame colour, with a mixture of blue: under tail coverts yellowish: quills blackish, outwardly edged with green, and within with grey brown: the two middle tail feathers are wholly green, the others are blackish, with green edges: legs and claws grey. This is the male.

The female has the colours less lively, and the green on the upper parts paler: it has neither the rufous fpot on the throat, nor between the nostrils and eye; and indeed the whole plumage is fcarcely tinged with blue.

Buffon observed one of these, which had two lines of green diverging from the lower mandible; and I have feen fuch another lately in a collection of birds from Cayenne.

That mentioned in the Petersburg Transactions, had the throat and mark between the bill and eyes of a yellow-colour.

This species is found at Cayenne.

SIZE of a Sparrow: length fix inches eight lines. Bill from fourteen to twenty lines in length, much arched at the end,

not

mot unlike that of a *Hoopoe*; colour black: the head is of a brownish ash at top: the hind part of the neck, the back, and rump, fine blueish ash: breast, belly, thighs, and under tail coverts, the same, but darker: the throat is black, extending some way down the neck: the lesser wing coverts are rose-colour; the greater the same on the outside, but black within: the greater quills are blackish, with the tips whitish; the outer edges of most of them, except the outer ones, are rose-colour; the second, third, sourth, and fifth *, have two spots of white on the inner web; the sixth has one white and one sulvous spot; and the rest have most of them a sulvous spot: eight of the middle tail feathers are blackish, edged with grey at the end; the two outer ones on each side have white tips: the legs and claws are black: the claws very long and crooked, especially that of the back toe.

The female has the same markings, and differs only in having the throat and sore part of the neck white, and in wanting the black spot on the throat. It has a loud and strong voice, which may be heard a great way off; but at the same time it is melodious. It lives on slies and spiders.

Authors mention this as a bird of Europe, being found in many parts of Italy, but especially at Auvergne +. Buffon does not rank it as a bird of France ‡; and I will venture to say that it was never found in England, whoever may affert to the contrary. This is a solitary bird; feeds on insects, and has the same manners

FEMALE.

with

^{*} A feather marked in this manner is represented in Edw. t. 361.

⁺ It is known by the name of Pic d'Auvergne. Scopoli, Salerne.

[†] I find it ranked with the rest as an inhabitant of Lyons, but is little known there. It never unites into bands, nor seen more than two and two together. Hift. de Lyon. i. p. 215.

with the common Creeper; but frequents ruined edifices, old walls, and the like, feeding on infects, but particularly spiders. Scopoli says, that it migrates singly towards the end of autumn. Its slight is vague and uncertain; and it climbs by leaps. It is probably not found in Sweden nor Germany, as neither Klein nor Frisch have mentioned it; nor has Linnaus ranked it with the birds of his country. Kramer says, that it is known to build in human skulls, in church yards; but surely this happened rather by accident than choice.

I have only feen one specimen of this bird, which is in the collection of M. Tunstal, Esq; and seemed to be larger than a Sparrow.

BROWN CR.

Lev. Mus.

DESCRIPTION.

ENGTH fix inches. Bill an inch long, moderately bent, and dusky brown; in the middle a pale orange spot: the plumage on the upper parts of the body brown: sides of the neck the same, edged with white: throat and breast barred brown and white: belly very pale brown: tail at least two inches and a half long, even at the end, and of a brown colour: quills brown, with pale edges: legs black: claws the same, long, and hooked.

PLACE.

- Said to inhabit fome part in the South Seas, but where un-

WATTLED CR.

Lev. Mus.

Description,

ENGTH feven inches and three quarters. Bill an inch long, and a little bent: the tongue longer than the bill, divided

for

for half its length into four fegments, like threads: at the base of the under mandible, just behind the gape, is a kind of membrane like a small wattle, of a yellowish colour, and about one-sixth of an inch in diameter; this is surrounded by a patch of yellow feathers, which extends under the eye: the irides are cinereous: the plumage is brownish olive green; the middle of the back darkest: the belly verging to ash-colour: the chin and throat are of a rusty orange-colour: the breast ferruginous: legs blue black: claws black.

One of these had no orange-colour under the throat; and all the under parts of the body were of an olive yellow: the tail was even at the end, and the edges of it and the quills olive yellow.

Inhabits Tongo Tabu, or Amsterdam Isle, in the South Seas.

PLACE.

CARDINAL CR. PL. XXXIII.

DESCRIPTION.

Lev. Muf.

SIZE of our Creeper. Bill the length of the head, curved from the middle to the point, but in a small degree; the base whitish, the rest black: the tongue is long, extensile, and ciliated for half its length: between the bill and eye a streak of black, which just encircles the eyelids all round: irides of a reddish chestnut: head, neck, and breast, crimson: down the middle of the back a stripe of the same colour to the rump: the rest of the body black: wings and tail black; the last even at the end; the wings reach about to the middle of it when closed: the legs are lead-coloured: claws black.

Inhabits the cultivated parts of the island of *Tanna*, and is there called *Kuyameta*. It lives by fucking the *netar* of flowers, and is not uncommon.

PLACE.

Yellow-

36. YELLOW-CHEEKED CR.

Yellow-cheeked Creeper, Gen. of Birds, p. 60. pl. 3. f. z.

DESCRIPTION.

NLY half the fize of the common Creeper: head, back, wings, and tail, green: cheeks and throat deep yellow: breaft and fides yellowish green, marked with blueish spots: belly yellow.

PLACE.

Inhabits Surinam.

BLUE-THROATED CR.

DESCRIPTION.

SIZE of a Wren: length four inches and a quarter. Bill nearly an inch, curved, and black: the top and fides of the head, taking in the eyes, hind part of the neck, and back, are green: chin, throat, and breast, deep blue: belly blue but paler: on each side of the neck, between the blue and green, yellowish white: quills and tail black: legs yellow: claws black.

PLACE.

Inhabits Cayenne. In the collection of the Dutchess of Port-land.

ORANGE-BREASTED CR.

DESCRIPTION.

I ENGTH four inches. Bill more than three quarters of an inch, curved, and black: the head, throat, hind part of the neck, back, and wing coverts, are green: quills and tail dufky black: the fore part of the neck of an high orange red: the breaft and belly pale yellow: legs dufky.

PLACE.

Inhabits Africa. From Mr. Smeathman.

Lev. Muf.

MOCKING CR.

DESCRIPTION.

ENGTH feven inches and a quarter: fize of the leffer Thrush. Bill somewhat bent, slender, long, and dusky; nostrils large, and covered with a membrane: tongue sharp, penicilliform at the tip: irides hazel: on the cheeks a narrow white spot: the head, especially on the crown, inclined to violet: the plumage in general is olive green, inclining to yellow on the under parts: the quills are brown: the secondaries edged with olive: the colour of the tail like that of the secondaries, and somewhat forked: legs dusky blue: claws black; the hind one the longest.

Inhabits both the islands of New Zealand. It has an agreeable note in general; but at times so varies and modulates the voice, that it seems to imitate the notes of all other birds; hence it was called by the English the Mocking-bird.

Place and Manners,

The specimen in the Leverian Museum has no red on the head, which is thus accounted for:—This bird being fond of thrusting its head into the bosom of slowers which have a purplish-coloured farina, much of it adheres to the feathers about the head and bill, and in course gives the appearance above mentioned; but this in time rubs off, and the colour of the head appears the same with the rest of the plumage.

RED-SPOTTED CR. Certhia cruentata, Lin. Syst. i. p. 187. N° 17. Le Grimpereau de Bengale, Bris. orn. p. 663. N° 31. Le Soui-manga rouge, noir, & blanc, Bust. ois. v. p. 514. Black, white, and red Indian Creeper, Edw. ii. pl. 81.

DESCRIPTION.

ENGTH three inches and a quarter. Bill less than fix inches; colour black: above, from head to tail, blue black: along this space are three large spots of a bright red; the one placed on the crown of the head, and reaching from one eye to the other; the second on the neck behind; and the third on the middle of the back: and the upper tail coverts are of the same colour: all the under parts are white: the quills and tail are blue black: legs black.

PLACE.

Its native place is Bengal.

YELLOW-RUMPED CR.

Le Soui-manga de l'isse de Bourbon, Buf. ois. v. p. 516. Grimpereau de l'isse de Bourbon, Pl. enl. 681. f. 2.

DESCRIPTION.

ENGTH about five inches. The bill is black: the upper part of the head and body greenish brown: the rump yellow, inclining to olive: the under parts of the body a mixed grey, having a tint of yellow near the tail: the sides are rusous: the quills blackish, edged with a lighter colour: the tail blackish: legs black.

PLACE.

Inhabits the Isle of Bourbon.

Buffon supposes it to be either a female, or a young one not yet come to maturity, and thinks it has the greatest affinity to the Soui-manga marron pourpre & violet, than any other.

Certhia

Certhia flaveola, Lin. Syst. i. p. 187. N° 18. Le Grimpereau, ou Sucrier de la Jamaique, Bris. orn. vi. app. p. 117. N° 33.

BLACK AND YELLOW CR.

Le Sucrier, Buf. oif. v. p. 542. Black and yellow Creeper, Edw. iii. pl. 122.

SIZE of a Wren. The bill is black: the head, throat, neck, back, scapulars, upper wing and tail coverts, are of a fine black: on each fide of the head is a stripe of white, beginning at the base of the bill, and passing over the eyes to the hind head: the breast, upper part of the belly, sides, edges of the wings, and rump, fine yellow: lower belly, thighs, and under tail coverts, yellow, but paler: under wing coverts white: the greater quills are white at the base, and black at the ends: the secondaries are wholly black: tail black; all the feathers except the two middle ones have white tips: legs and claws blackish.

DESCRIPTION,
MALE.

Inhabits Jamaica.

42. Var. A. YELLOW. BELLIED CR.

EDWARDS describes this bird as having the dimensions of the other. A stripe of yellow over the eyes: the bill dusky: the upper parts brownish ash-colour, except the tip of the tail, and bottom of the greater quills, which are white: under side yellow,

DESCRIPTION: FEMALE.

5 B

changing

changing to white at the vent: the upper tail coverts yellowish: legs dusky.

Edwards supposes this the female.

Briffon fays, that only the two outer tail feathers have white tips.

PLACES AND VARIETIES.

These birds, at least varieties of them, are found at *Martinico*, *Cayenne*, *St. Domingo*, and other parts. That of *Cayenne* has the head blackish, with two stripes of white over the eye: the throat of a light cinereous grey: back and upper wing coverts the same, but deeper: quills and tail the same, bordered with cinereous: fore part of the wings edged with pale yellow: rump yellow, as are the under parts of the body; but mixed with grey on the belly: legs blueish.

This was described to Buffon as a male, but he thinks it has much affinity with that mentioned by Sloane; who says, that his bird had a short song, but very agreeable. Buffon's bird had only a weak cry, Zi, zi, like a Humming-bird. He likewise mentions another from St. Domingo, which had the bill and tail rather shorter, white eye-brows, and a fort of grey patch on the throat: larger than that of Sloane's female; but in other matters persectly resembled it.

MANNERS.

These birds feed on the sweet viscous juice which is found in the sugar-cane; but it is not certain that they draw their whole nourishment from this plant; perhaps others containing sweet juices may serve them in turn. They infinuate their bill into any crevice or crack of the stalk, and draw out the juice, as has been observed. It may not be amiss to suppose that they likewise seed on insects, as the rest of the Creeper family are known to do, though observation has not yet consirmed it.

Certhia

Certhia Bahamenfis, Lin. Syft. i. p. 187. No 18. B. Le Grimpereau de Bahama, Brif. orn. iii. p. 620. Nº 8. Bahama Titmoufe, Catef. Car. i. pl. 59.

VAR. B. BAHAMA CR.

THIS is a trifle bigger than our Creeper: length four inches eight lines. Bill half an inch, and black: on the upper parts of the body the plumage is brown; beneath yellow: the ridge of the wing is also yellow: the throat is paler than the rest of the plumage: and the lower part of the belly, vent, and under tail coverts, are brown: over the eye, on each fide, to the hind head, is a stripe of white: wings and tail brown; the edges of the feathers of the last are dirty white: legs and claws brown.

DESCRIPTION.

Inhabits the Bahama Isles. Linnaus seems to think this bird a mere variety of the last mentioned.

PLACE.

Lev. Muf.

- CRIMSON

DESCRIPTION.

I ENGTH five inches. Bill dufky, not very hooked, though bent; three quarters of an inch long: the body in general crimfon, the upper parts deepest: quills black: the secondaries margined with cheftnut: belly dusky: vent white: the tail black; all the feathers rather pointed at the end; the shafts white: legs black.

Inhabits the Sandwich Islands.

LENGTH

5 B 2

740

OLIVE-GREEN CR.

Lev. Mus.

DESCRIPTION.

ENGTH five inches. Bill very little curved, and of a dufky colour; pale at the base: between the bill and eye dufky:
- plumage olive green, palest beneath: quills and tail the same, but more dusky; both edged with yellow: legs dusky.

PLACE.

Inhabits the Sandwich Islands. This is by some supposed to be the female of the last; which is by no means unlikely, as several birds, of which the male is red, the semales are green *.

SCARLET GR.

Lev. Muf.

DESCRIPTION.

SIZE of a Wren: length scarcely four inches. The bill is half an inch long, very little bent, and of a black colour: the general colour of the plumage is scarlet, except the wings and tail, which are black: and the lower part of the belly and vent white: the legs and claws are black.

PLACE.

This is in the Leverian Museum, and is faid to have come from fome part of the South Seas.

cinnamon cr.

Br. Mu/.

DESCRIPTION.

ENGTH five inches. Bill very little bent, and black; about three quarters of an inch in length: the upper part of the plumage is the colour of cinnamon; the under parts white: the tail made like our *European* Creeper, and of the fame colour as the upper parts of the body: legs dufky.

In the British Museum.

AMBOINAN CR.

Description.

THE length of this species is two inches and three quarters. Bill half an inch, and yellowish: the plumage is cinereous grey above, and green beneath: the head and neck yellow, edged with green: the breast is of a fine red: wings black: edge of the wings and quills yellow; the last edged with light green: the whole bird is brilliant and glossy.

Inhabits

742

PLACE.

Inhabits Amboina.

Both Edwards* and Buffon + observe, that Humming-birds are peculiar to South America; and that none are found on any part of the old continent. It is most probable then that the three last mentioned may belong to the Creeper genus, on our better acquaintance with them; which is the more to be supposed, as the whole description has been taken from Seba, who lived in an age not sufficiently enlightened in these matters.

BIRDS of this genus have

The bill slender and weak, in some incurvated, in others strait; nostrils minute.

Tongue very long, formed of two conjoined cylindric tubes; missile.

Toes three forward, one backward.

Tail confifts of ten feathers.

Legs weak.

The following are divided into two families, the one with curved bills, the other with ftrait ones: which appears to be far better than making two genera of them, as fome authors have done; especially as they have identically the same organs, and method of providing themselves with food, as well as general manners.

The use of the bill in most birds is to collect the food; but in this genus it feems to ferve for little other purpose than as a case of defence for the tongue, as it is by means of this last alone that it gets its nourishment, which is ever in a liquid state, and which it draws up in the manner of the Elephant, by means of the probofcis, or, to descend to the lesser animals, in the common Fly, by its trunk; though indeed neither of these is quite to our purpose, but the tongue or trunk of what is called the Hawk-Moth * is exactly fimilar: this last is composed of a double tube, and is bifid at the end like that of a Humming-Bird; the difference is merely, that in the last the tongue is elongated or contracted in a strait direction, defended by the bill; in the Hawk-Moth it is coiled up in a spiral manner, like the spring of a watch, and in this situation is guarded by a lateral valve on each fide. We cannot here enter into further particulars, as fuch a disquisition, if carried to a proper length, would be fitter for an anatomical, than any other defcription of the subject in question.

Br. Muf. Lev. Muf.

THE bill of this species is much bent, an inch and a half or more in length, being out of proportion to the body, the whole length of the bird, from bill to tail, being less than six inches: the plumage above is brown, with a gilded gloss: over each eye is a whitish stripe: the wing coverts are brown: the quills the same, but inclining to violet: the under parts of the body rusous white: the two middle feathers of the tail exceed the others in length above an inch; the others are not of equal lengths, those nearest the middle being much longer than the outer ones, which are very short; the two middle ones are half gilded brown, the end half white; the others have likewise their lowest half

DESCRIPTION.

This figure may deceive: the two middle tail feathers have the ends coloured brown, instead of white; and the rest of the tail feathers are all of equal lengths; whereas they should be all unequal.

gilded brown, then black, with the ends brown, edged with white: legs and claws brown.

PLACE.

Inhabits Cayenne.

BLACK-CAPPED H. B. Trochilus polytmus, Lin. Syst. i. p. 189. N° 4. L'Oiseau-mouche à teste noire, & queue fourchue, Bris. orn. iii. p. 729. N° 19. L'Oiseau-mouche à longue queue noire, Bus. ois. vi. p. 39. Long-tailed Humming-bird, Albin. iii. pl. 49. Long-tailed black-cap Humming-bird, Edw. i. 34.—Bancr. Guian. p. 169. Br. Mus. Lev. Mus.

DESCRIPTION.

HE whole length of this bird, taking in the long tail feathers, is above nine inches and a half. The bill is ten lines in length, very little bent, in colour yellow, with a black tip: irides yellow *: the top of the head, and a little way on the neck behind, black: the upper parts in general are of a yellowish green: the under parts of a glossy bluess green: edge of the wing white: wing coverts violet brown; quills the same, the margin of the first white: the tail feathers are blackish, and very unequal in length; the two outer ones being sourteen lines long, the two next seven inches, the next to these only one inch, and the two middle ones only half an inch; these different lengths making the tail appear forked: the legs are black.

FEMALE.

I do not find an author who has mentioned the female; but in the same case with one of these birds, at Leicester-bouse, is one sent for the mate of this species: the size of the bird, and the bill, exactly the same: the base of the under mandible white half way; the rest, and upper, black: the crown is of a dusky brown: the upper parts of the body are of the same kind of green as in the

* Albin.

other

other fex: all the under parts from the chin to the vent white: close to the green, the white on each fide of the neck is marbled with green, as if nature did not choose that the different colours should be too abruptly divided: the tail is green, but without the long feathers; and the tips of all but the two middle ones are white nearly half way from the tip.

This inhabits Jamaica, Guiana, and the fouth parts of America. Albin fays, he found it on its neft, which was made of cotton, but describes it as a small species.

Both Buffon and Briffon have ranked this and the next with the ftrait-billed birds; but Linnæus and Klein with the crooked ones: on examination, there will be found a curvature, just enough to justify this division in sentiment.

PLACES:

Le Colibri à longue queue du Mexique, Bris. orn. iii. p. 688. N° 14. Le Brin bleu, Bus. ois. vi. p. 51. Avis, Yayauquitotot! * dicta, Seba, i. p. 84. t. 51. f. 7.

BLUE-TAILED H. B.

THIS is a large species, being compared by Brisson almost to the size of a Fig-eater: length eight inches and a quarter. The bill in length is an inch and a quarter, and of a yellowish colour: the fore part of the head, about the eyes, the throat, and fore part of the neck, are blue: the upper parts, from the nape to the vent, are green, but deepest on the back: from the breast to the vent the colour is cinereous grey: the two middle feathers of the tail are of a fine blue colour, and longer than the side ones by two

DESCRIPTION.

* This is quoted by Briffon, and may be the bird meant by Seba; but Buffon observes, that Yayauquitototl is also the name of a bird mentioned by Hernandez, as big as a Starling.

inches

750

inches four lines; the others fine green, and lessen by degrees outwardly to the last, which is very short: the legs are yellow.

PLACE.

Inhabits Mexico.

LESSER FORK-TAILED H. B.

DESCRIPTION.

THE whole length of this species is four inches, of which the tail is an inch and a half. The bill is black, and very little curved: the top of the head, and the neck, are of a gilded-green colour: the back and breast glossy violet blue: the throat, and lower part of the back, gilded green: the lesser wing coverts violet; the greater green gold: quills black, as are the tail seathers; the two outer ones longer than the others, rendering the tail forked, but the longest feather is only one inch and a half in length: legs and claws blackish.

Inhabits Jamaica, Brasil, and Cayenne.

PLACES.

8. CAYENNE FORK-TAILED H. B.

ENGTH of the bird fix inches. Bill eleven lines long, black, and fcarcely bent: the head, throat, and neck, of a violet blue: general colour of the plumage gloffy green gold: on the

Description.

• I have omitted here the references to Ray, Willughby, and Sloane, as I cannot reconcile them at all; they seem to suit the next species better. Linnæus has thought right to unite this to the last; but soon the difference of colour, as well as size, it appears to me clearly right to keep them separate.

lower

lower part of the belly is a white fpot: the tail is forked; the two outer feathers are three inches and three quarters long, and the middle ones an inch and three quarters only; the colour of it black blue, with a gloss of polished steel: the legs are black.

PLACE.

Inhabits Cayenne. Buffon observes, that this description best fuits that of Marcgrave, which Briffon has put down as synonymous with the last mentioned; and not only corrects that error, but likewise that of Ray and Willughby, dependent on Marcgrave's authority.

As these four have the bills curved, though in a very small degree, I place them in this division, rather than rank them with those whose bills are absolutely strait.

GARNET-THROATED
H. B.
PL. XXXIV.
DESCRIPTION.

ENGTH four inches and a quarter. Bill an inch long, bent, and black: head, neck, back, and tail, very dark green, appearing blackish in some lights, and glossy green in others: wing and upper tail coverts glossy green: from the chin to the breast the feathers are of a fine deep garnet-colour, appearing very glossy in some directions: the belly, thighs, and vent, black, with a very faint greenish gloss: legs black.

FEMALE.

The female, or what was given to me as fuch, has the upper parts of the body like the other: from the chin to the breast green gold, instead of glossy garnet-colour: the belly, thighs, and vent, dusky black: the quills dusky: tail and legs black.

Garnet-throated Humming-Bird.

Le Grenat, Buf. eif. vi. p. 48.

9. Var. A.

THE length of this bird is five inches. The bill is ten or twelve lines long: the cheeks just beneath the eye, the sides and lower part of the neck, and the throat as far as the breast, are of a fine bright garnet-colour: the upper part of the head, the back, as well as the under parts of the body, are of a velvety black: the wings and tail are of the same colour, but gilded with green gloss. This is the whole of Buffon's description; from which I have ventured to place it as a variety, arising eith critic age or sex.

DESCRIPTION.

Trochilus jugularis, Lin. Syft. i. p. 190. N° 7. Le Colibri à gorge carmin, Buf. oif. vi. p. 56. Red-breasted Humming-bird, Edw. glean. t. 266. f. 1.

RED-BREASTED H.-B.

THIS species is four inches and a half long. The bill is thirteen lines in length, and pretty much curved, not unlike that of a Creeper, and black: the top of the head, hind part of the neck, the belly, thighs, and tail, of a dusky brown or black; the edges of the feathers a little fringed with blue: the sides of the head, and the throat as far as the breast, fine red or carmine, and bright as a ruby: the wings are of a fine dark green, with a gloss like that of polished gold; inside green: the rump, and upper and under tail coverts, fine blue: legs short and blackish.

DESCRIPTION.

This is an inhabitant of Surinam.

PLACE.

VIOLET-TAILED H. B.

Le Colibri à queue violette, Buf: ois. vi. p. 55:

de Cayenne, Pl. enl. 671. f. 2:

Description.

THE length of this bird is fix inches; that of the bill fixteen lines, and bent. The fides of the throat are white; down the middle it is brown mixed with green: the fides are the fame: the breast and belly white; the quills of a violet brown *: all the upper parts of the body, placed in an opposite view, appear richly gilded, and, viewed on one side, look green: the four middle feathers of the tail are of a deep violet, glossed with a gilded yellow; the fix outer ones are violet also, but have the tips, and part of the inner margins, white: legs dusky.

PLACE.

Inhabits Cayenne.

+ BLACK-RELLIED H. B. Trochilus holosericeus, Lin. Syst. i. p. 191. Nº 11: Le Colibri du Mexique, Bris. orn. iii. p. 676. Nº 7. t. 35. f. 22. Le Colibri vert & noir, Bus. ois. vi. p. 53. Black-bellied green Humming-bird, Edw. i. t. 36. Black-bellied American Humming-bird, Bancrost Guian. p. 169.

DESCRIPTION.

ENGTH four inches and a quarter. Bill black, rather more than an inch in length: the head, neck, and upper parts of the body, are green gold, with a gloss of copper: the breast, belly, sides, and thighs, shining black, with a reddish tinge: across the breast is a transverse band of blue, and on the lower part of the belly another lesser one of white: the tail is deep

* The quills of most of the Humming-birds seem to be nearly of this colour.

black,

black, with a blue gloss like polished steel; all the feathers are of equal lengths: legs black.

Edwards has figured another with this, in the same plate, which he supposes the female, as it answered the above description in all things, except that the white mark on the belly was wanting.

I have one of these birds, which, instead of the white on the belly, has only a white spot on each side, and the bird is rather dess in size.

Inhabits Mexico and Guiana.

PLACES.

GREEN-THROATED H. B.

HIS is about the same size as the last; but the bill is not so long. The upper parts of the body and tail are of a deep gilded green: on the throat is a dash of very bright emerald green,

DESCRIPTION.

HUMMING-BIRD.

green, which grows broader on the fore part of the neck: on the breast is a black spot: the sides of the throat are rusous, mixed with white; and the belly pure white: the tail beneath has the same violet, white, and polished-brown spots as in the last species, which caused Busson to suppose it allied to that bird, or at least a variety.

FEMALE.

He mentions also another, in the cabinet of *M. Mauduit*, of the same size, having the upper parts light green and gold on a blackish grey ground, and all the sore parts of the body rusous, which appeared to him as a *female* of the above described.

VIOLET H. B. Le Colibri violet de Cayenne, Bris. orn. iii. p. 683. N° 11. t. 35. f. 3. Le Colibri violet, Bus. ois. vi. p. 57. Colibri violet de Cayenne, Pl. enl. 600. 2.

DESCRIPTION.

HE length of this bird is four inches and a quarter. The bill almost one inch, black, and not quite so much curved as in the last: the whole head, the neck, back, breast, and belly, of a violet purple, very glossy on the throat and breast, but elsewhere verging to velvety black: the wings gold green: tail the same, with a changeable gloss of black: legs black.

PLACE.

Inhabits Cayenne.

BLACK-BREASTED H. B.

Le Hausse col vert, Buf. ois. p. 58.

DESCRIPTION.

HIS is rather bigger than the violet-tailed Humming-bird; but the bill is much the fame. The fore part and fides of the neck, and lower part of the throat, are of an emerald green:

the chin, just under the bill, bronzed: the breast is velvet black, with an obscure tinge of blue: the upper parts of the body and sides are green gold: the belly white: the tail is purplish blue, with a steely brown gloss, and does not reach beyond the ends of the wings when closed.

The female, or at least one supposed to be so, had the same distribution of colours with the above, except that the green on the fore part of the neck was divided by two white dashes, and the black on the breast neither so broad, nor of so dark a colour.

Both these are in the cabinet of Dr. Mauduit, at Paris.

FEMALES

Trochilus leucurus, Lin. Syft. i. p. 190. N° 6: Le Colibri de Surinam, Brif. orn. iii. p. 674. N° 5. Le Collier rouge, Buf. oif. vi. p. 59. Le Collier à collier de Surinam, Pl. enl. 600. f. 4. White-tailed Humming-bird, Edw. glean. t. 256. WHITE-TAILED H. B.

ENGTH four inches and a half. Bill thirteen lines long, curved, black, lightest at the base: the plumage on the upper parts of the body green gold, with a copper gloss; beneath greyish white: on the breast is a crescent of red: wings dark purple on both sides: the two middle tail feathers are the same colour as the upper parts, and the eight others white: the legs are black.

Descriptions.

It is found at Surinam. Linneus observes, that the two outer tail feathers are black at the tips.

Mango Humming-bird, Albin. iii. t. 49. b.

DESCRIPTION.

TENGTH four inches and a third. Bill an inch long, not much curved, and blackish: the head and upper parts of the body are green gold, with a copper gloss: throat, fore part of the neck, breaft, belly, and fides, bright velvet black; this colour is feparated from that of the upper parts by a stripe of very shining blue, which arises at the corners of the mouth, and extends on each fide of the neck and breast: the thighs are brown: the vent white: the under tail coverts violet brown: the quills and greater coverts the fame: the two middle tail feathers are black, with a gilded violet gloss; those on the sides glossy purplish chestnut, and margined with a fteely black nearly all round: legs black.

FEMALE.

The female has the upper furface of the body and wings the same as the last, as are the chin and throat; but the breast and belly are black: the tail as in the other; but the outer feathers have brown ends, the two middle ones being green, like the upper parts of the body.

PLACE.

Inhabits Mexico, Brafil, and St. Domingo; Albin fays also 7amaica; and that it builds its nest in the physic-nut tree, making it of cotton, and laying two white eggs, as big as peas.

WARIETY.

I have seen a variety of the male of this bird, having the throat and

and fore part of the neck white, down the middle of which was a stripe of black from the chin to the breast.

Largest or blackest Humming-bird, Raii syn. p. 187. No 43.—Sloan. Jam. p. 308. No 40.

18: + VAR. A:

Br. Mus. Lev. Mus.

ENGTH four inches. Bill an inch, somewhat curved, and black: the upper part of the body blackish green; the ends of the feathers margined with copper; but this is not brilliant, nor does it appear at all glossy, except in particular lights, having for the most part the appearance of dusky black: the chin, fore part of the neck, and breast, are purple and glossy: down the middle, the whole way from the chin, is a stripe of black: the belly is dusky: on each side the vent is a small tust of white feathers: the two middle tail feathers, and upper tail coverts, are dark green; the others purple, with a gloss of copper, margined at the tips with black: the legs are black.

DESCRIPTION ...

I have received several of these birds from Jamaica, and have seen them likewise in the collections of others, but cannot think them the same with the last described; indeed, the distribution of colours is somewhat the same, but the colours themselves are quite different; the bird, therefore, last described is at least a strong variety, if not a different species.

PLACES .

ENGTH fix inches. Bill a little bent, and black; the under mandible yellow almost to the tip: the plumage on the upper parts of the body is of a fine glossy green; beneath ash-

Oiseau-mouche à poitrine bleue de Surinam, Pl. enl. 227. s. 3.

Green and blue Humming-bird, Edw. i. t. 35. f. 2.

DESCRIPTION.

ENGTH not quite four inches. Bill ten lines and a half long, and black: head, throat, neck, lower part of the back, rump, scapulars, and upper tail and leffer wing coverts, green gold, glossed with copper: upper part of the back blue: breast, upper part of the belly, and sides, the same, with a bright gold cast: lower part of the belly and sides, thighs, and under tail coverts, dull brown: greater wing coverts, quills, and tail, brown; the two middle feathers of the last not so long as the others: legs and claws black.

PLACE AND OBSERVATIONS.

Inhabits Surinam. Edwards thinks it not unlikely, that this may be the other fex of the last mentioned, but neither Linnæus, Brisson, nor Busson join him in that opinion: I cannot see what led him to think it, except the circumstance of the middle tail feathers being shorter than the rest in both birds.

^{*} In my specimen the tail feathers are twelve in number; the two middle ones green, the rest white, as above mentioned.

LENGTH

VAR. A. DESCRIPTION.

I ENGTH three inches and three quarters. Bill three quarters of an inch, strait, dusky; the base of the under mandible white: the head, neck, and upper parts of the body, are green: on the chin a fpot of pale orange: breast and belly blue: the quills and tail dusky: legs black.

From the collection of the Dutchess of Portland. It seems to be a variety of the former.

Le grand Oiseau-mouche de Cayenne, Bris. orn. iii. p. 722. No 15. t. 37. f. 3. L'Oiseau-mouche à oreilles, Buf. ois. vi. p. 32.

Br. Muf.

EARED H. B.

PRISSON describes this species in the following manner:—the DESCRIPTION. length four inches feven lines: that of the bill eleven lines; colour black: all the upper parts of the head, neck, and body, are green gold; beneath white: on each fide of the head is a band of black, beginning at the base of the bill, passing under the eyes, and finishing behind them: behind this band, beneath the ears, is a very splendid violet spot: the thighs are brown: four of the middle tail feathers are black, inclining to deep blue, the others white: legs feathered to the toes; colour of them blackish: the violet fpot behind the ears is composed of two tufts of feathers; which are above double the length of the others, being more foft and downy, and the webs very loofe; these are each composed of five or fix feathers, and are of an amethystine-blue: colour.

HUMMING-BIRD.

FEMALE.

768 -

The female has not these tusts, nor is the black stroke under the eye so distinct as in the male; otherwise it resembles it in all respects.

PLACE.

These birds are natives of Cayenne.

33. Var. A. Br. Muf.

DESCRIPTION.

ENGTH five inches. Bill ftrait, dusky; the base of the lower mandible white: the seathers of the crown are a little elongated, loose, and green: from the corners of the mouth begins a purplish streak, which passes under the eye, beyond which it spreads into a broad patch, and finishes on the ears: beneath this is another patch of greenish blue, reaching to about the middle of the neck on each side: the rest of the plumage, on the upper parts of the neck, back, and wing coverts, green: quills dusky: all the under parts, from the chin to the vent, are white: the legs dusky.

RUBY-THROATED H. B. L'Oiseau-mouche à gorge rouge de Cayenne, Bris. orn. iii. p. 720. t. 37. f. 4. Le Rubis emeraude, Buf. ois. vi. p. 31.

Oiseau-mouche à gorge rouge du Bresil, Pl. enl. 276. f. 4.

DESCRIPTION.

ENGTH above four inches and a quarter. The bill is eleven lines long, and of a black colour: the plumage is green gold, but gloffed with copper on the upper parts: the throat is the colour of a glowing ruby, changing to green and gold in different aspects: the greater wing coverts are rusous, with violet brown margins: quills the same: the two middle tail feathers

are

are rather shorter than the others; all of them are rusous, with gilded greenish brown margins: legs and claws black.

Inhabits Brafil and Guiana.

PLACE.

Trochilus colubris, Lin. Syft. i. p. 191. No 12.

Humming-bird, Catefb. Car. i. t. 65.

Red-throated Humming-bird, Edw. i. t. 38. male and female.—Amer. Zool. No

Br. Muf. Lev. Muf.

I ENGTH three inches and one-third: bill three quarters of an inch. The male is green gold on the upper part, with a changeable copper gloss; the under parts grey: the throat, and fore part of the neck, of a ruby colour; in some lights as bright as fire itself; viewed sideways appears mixed with gold; and beneath looks of a dull garnet colour: the two middle feathers of the tail are the same as the plumage on the upper part of the body; the others of a purplish brown: the tail a trifle forked.

The female differs chiefly in not having the beautiful ruby throat, but instead, has only a few obscure small brown spots; and all the outer tail feathers are tipped with white, which are plain in the male *.

The bill and legs are black in both fexes.

* Many specimens have all the under parts white, and are less in fize; but whether females or young birds is not certain.

←RED-THROATED

Description.

Male.

FEMALE.

PLACES AND MANNERS. This elegant species is common in Carolina, and, like the Ruff-Necked, visits the more northern parts of America; we hear of it in Canada *, and even as far as the Bay of Gaspe +; and I have authority for saying, that it breeds both at Halisax and Quebec.

Kalm ‡ informs us, that they come into *Penfylvania* in fpring, when pretty warm, and make their nests in summer; towards autumn departing to the south.

These birds subsist on the nectar or sweet juice of flowers; they frequent those most which have a long tube; particularly the Impatiens noli me tangere, the Monarda with crimson flowers, and those of the Convolvulus tribe: they never settle on the flower during the action of extracting the juice, but flutter continually, like Bees, moving their wings very quick, and making a humming noise; whence their name \script: they are not very shy, suffering people to come within a foot or two of the place where they are, but on approaching nearer sly off, like an arrow out of a bow: they often meet and sight for the right to a flower, and this all on the wing \script: in this state often come into rooms where the windows stand open, sight a little, and go out again **. When they come to a flower which is juiceless, or on the point of

[§] Whoever has feen in England the method by which the Sphinx-moths take in their nourishment, will have a just idea of that of the Humming-bird, especially that species called the Humming-bird-moth.

Il Often flying to a vast height quite perpendicular, shrieking out at the same time with all their might.

^{**} They are often caught in this manner, as they directly make to the cieling, in the manner of Moths.

withering, they pluck it off, as it were in anger, by which means the ground is often quite covered with them. When they fly against each other, they have, besides the humming, a fort of chirping noise, like a Sparrow or Chicken. They do not feed on insects nor fruit; nor can they be kept long in cages, though they have been preserved alive for several weeks together, by feeding them with water in which sugar had been dissolved.

This bird most frequently builds on the middle of a branch * Nest and Eggs. of a tree, and the nest is so small, that it cannot be seen by a person who stands on the ground; any one, therefore, desirous of seeing it must get up to the branch, that he may view it from above; it is for this reason that the nests are not more frequently found. The nest is in course very small, and quite round; the outside, for the most part, is composed of green moss, common on old pales and trees; the inside of soft down, mostly collected from the leaves of the great Mullein†, or the Silk-grass‡; but sometimes they vary the texture, making use of Flow, Hemp, Hairs, and other soft materials: they lay two eggs of the size of a pea, which are white, and not bigger at one end than the other.

The above account of the manners will, in general, suit all the birds of this genus; for, as their tongues are made for suction, it is by this method alone that they can gain nourishment: no wonder, therefore, they can scarcely be kept alive by human artifice §.

L'Oiseau-mouche à gorge tachetée, Buf. vi. p. 31. Oiseau-mouche tacheté de Cayenne, Pl. enl. p. 276. f. 2.

DESCRIPTION.

THIS bird is near four inches long, and the bill is eleven lines; the upper mandible is black; the lower whitish, with a black tip: general colour of the plumage green gold, glossed with copper: on the breast the feathers are fringed with white: and the belly, under tail coverts, and thighs, are grey: all the tail feathers are steel black; but the two middle ones have a copper gloss; and all the others are tipped with grey: legs and claws black.

Buffon observes, that it has great affinity to the next described, except that it is bigger, otherwise one description might serve.

36. Var. A.

Lev. Muf.

ONE in the Leverian Museum answers very nearly to the above description. The length of the bird and the bill perfectly coincide: the plumage above is green gold, glossed with copper:

four months, by the following method:—he made an exact imitation of some of the tubular slowers with paper, fastened round a tobacco-pipe, and painted them of a proper colour; these were placed in the order of nature, in the cage wherein these little creatures were confined: the bottoms of the tubes were filled with a mixture of brown sugar and water, as often as emptied; and he had the pleasure of seeing them perform every action; for they soon grew familiar, and took the nourishment in the same manner as when ranging at large, though close under his eye.

throat,

throat, and fore part of the neck, green gold; each feather margined with grey: the breaft, belly, vent, and under tail coverts, white: the region of the vent feems covered with down, not feathery, like the rest: the quills blue black; tail greenish black, and not tipped with white. This last circumstance is the case also in a specimen in my possession, in which the tail is much rounded in shape, and the under tail coverts green; but in every thing besides, it perfectly agrees with the last described.

Trochilus mellisugus, Lin. Syft. i. p. 192. Nº 15. L'Oiseau-mouche de Cayenne, Bris. orn. iii. p. 704. Nº 6. t. 36. f. 3. Le vert-doré, Buf. oif. vi. p. 29. Oiseau-mouche de Cayenne, Pl. enl. 276. f. 3. Guianumbi nona species, Raii Syn. p. 83. No 9.-Will. orn. p. 232. No 9. Lev. Mul.

I ENGTH from bill to tail two inches ten lines. Bill eight lines and a half in length, and black: plumage in general green gold, bronzed with copper: thighs and under tail coverts grey brown: vent feathers white: quills violet brown: tail fteel black: legs covered to the toes with brown feathers: toes and claws black.

Inhabits Cayenne: Buffon fays, that his specimen had the belly only waved with green; and mentions, after Marcgrave, that the lower mandible was rufous.

DESCRIPTION.

PLACE.

38. BLACK H. B. Trochilus niger, Lin. Syst. i. p. 192. N° 17. L'Oiseau-mouche de St. Domingue, Bris. orn. iii. p. 702. N° 5. t. 36. f. 8.

DESCRIPTION.

ENGTH two inches and a quarter. Bill five lines and a half, and black: the head, and from thence to the tail, above, the parts are brownish black with a copper gloss: sides and thighs grey brown, glossed with the same: the throat, fore part of the neck, breast, and belly, whitish grey: on the throat are some minute brown specks: under tail coverts white quills as usual: tail steel black: legs covered to the toes with grey brown feathers: toes and claws black.

PLACE AND OBSERVATIONS.

Inhabits St. Domingo. Brisson doubts whether this is not the female of the last: Busson * joins him in opinion; and further observes, that the last but one may be taken in also; the only difference in that and the two last, is in its being bigger: Notwithstanding this, Linnaus will have this last a distinct species; and, as I can by no means decide the matter, must leave it to the surre observations of others: I will only make one remark on the almost impossibility of determining these things, without a long residence on the spot where they breed, since I am credibly informed, that they do not gain their true plumage for the first, nor even the second year; and, in this intermediate state, must deceive, and perhaps strangely multiply the species. This case we know is manifest in many other birds, which we are now thoroughly acquainted with, and had led ornithologists into many mistakes, till their nature and manners were fully known †.

40. SAPPHIRE AND EMERALD

HIS species is about the middle size. It is made up of the two colours expressed in the title, viz. the sapphire and the emerald; both colours persectly vivid and glossy; the first occupying the head and throat, and blending itself with the second, which covers the breast, stomach, round the neck, and the back,

DESCRIPTION-

Hift. des oif. vi. p. 27.

gloffed

gloffed with gold-colour; giving the bird, on the whole, a most beautiful appearance.

PLACE.

This inhabits Guadeloupe.

I think this must be the bird mentioned by Fermin, which is green and gold above: throat emerald-green: breast blue, glossed with gold, very brilliant: the bill strait, and an inch in length.

DUSKY-CROWNED H. B.

Br. Muf.

Description.

ENGTH four inches and a quarter. Bill three quarters of an inch; strait, and dusky: the whole top of the head, taking in the eye on each side, is dusky: chin and throat glossy green: hind part of the neck, and upper part of the back, deep blue: breast, belly, and wing coverts, purplish blue: middle of the back inclining to green: lower part of the back, rump, tail, and quills, dusky purple: legs black.

In the British Museum.

+ BROWN-CROWNED H. B.

DESCRIPTION.

LENGTH three inches. Bill strait, black, and three quarters of an inch in length: on the middle of the crown a spot of brown, reaching to the base of the bill: the plumage on the upper parts glossy brown; beneath dirty white: belly white: down the middle of the throat and neck, as far as the belly, passes a green gold stripe: quills black: tail cinnamon-coloured at the base, and dusky at the ends: legs black.

PLACE.

In the collection of Miss Blomefield, who received it from Holland, to which place it was probably brought from Surinam.

I have

I have two specimens of this bird, which are near four inches in length: in one the whole crown is brown: down the middle of the throat a streak of brown, but not glossy: the tail rusous, for two-thirds of its length, with the end dusky black: the tips of all the feathers margined with white on the upper side, but on the under deeply tipped with the same colour: the two middle feathers are wholly of blue black, glossed with rusous in some lights.

The other has the crown greenish brown, with a rusous streak over each eye: the streak down the throat dusky, and much broader than in the first: rump and under tail coverts pale rusous.

These came from *Tobago*, and seem clearly to be in some of the progressive stages towards perfection, if not *females*; which last is not unlikely from the ends of the tail being white.

RUBYCRESTED
H. B.

Trochilus elatus, Lin. Syft. i. p. 192. No 19: L'Oiseau-mouche à gorge topaze d'Amerique, Bris. orn. iii. p. 697. No 22 L'Oiseau-mouche à gorge topaze de Cayenne, Pl. enl. 640. f. 1. Ruby-cressed Humming-bird, Edw. glean. t. 344. Lev. Mus.

DESCRIPTION.

EDWARDS describes this in the following manner:—The bill is black: the head crested, of a slame-colour, with the lustre of a ruby: the throat like burnished gold, glossed with emerald: body, and wing coverts, dull brownish olive: quills purplish: tail cinnamon-colour tipped with black: lower belly, and under tail coverts, cinnamon: across the middle of the belly is a white line: and the bright spot on the throat divided from the neck: and breast by a dusky line: legs black.

PLACES AND OBSERVATIONS.

Said to be natives of Guiana and Terra firma.—I have also received specimens both from Cayenne and Tobago. This bird seems to be akin to the last, as that in Edwards's plate, and in the Planches enluminées are very similar; except that in the last, the crest scarcely stands up from the head; it is therefore probable that it may have been a bird not yet come to its sull degree of persection, or perhaps differing from climate.

There.

There is no doubt but the bird in *Brisson*, above quoted, is related to this, being no difference, except in the body of his being green; whereas in the others above described, it is more or less inclined to brown.

48. + TOBAGO H. B.

DESCRIPTION

ENGTH four inches. Bill three quarters; colour dusky; the under mandible yellow, except at the tip: head, neck, back as far as the middle, and beneath as far as the belly, glossy green: lower part of the back, rump, and wing coverts, green glossed with copper: across the lower part of the belly a white bar: thighs white: vent and under tail coverts very pale brown: quills and tail blue black; the last somewhat forked: legs black. I received this from Tobago.

PLACE:

Small green and crimson Humming-bird, Bancr. Guian. p. 168.

49. GUIANA H. B.

LENGTH little more than two inches. The bill is black, long, and slender: the feathers on the neck, back, and upper edges of the wings, have a beautiful pea-green colour: the top of the head is crested with a small tust of a variable crimson colour: the feathers of the breast are likewise crimson: and the long feathers on the wings and tail are green, crimson, and dark purple:

DESCRIPTION.

This is Mr. Bancroft's description; who adds, that it is the most frequent of all the Humming-birds in Guiana, and seems peculiar to it.

the head is fmall, with little, round, black, shining eyes.

BLACK AND BLUE H. B.

Black and blue Humming-bird, Bancr. Guian. p. 167.

DESCRIPTION:

THIS is near twice the fize of his blackHumming-bird, or N° 29. The large feathers on the wings and tail, are of a beautiful shining black: those of the throat and breast of a changeable crimson, reslecting a variety of shades in different lights.

PLACES.

This, and the black, are faid to be common to many places in Terra-firma and the Caribbee Islands. He does not expressly mention the colour of the body; but it is clearly black and blue from the title; though in what proportion, or how blended, is quite uncertain.

CARBUNCLE H. B.

L'Escarboucle, Buf. oif. vi. p. 28.

DESCRIPTION.

THIS bird is fomewhat above the middle fize. The bill, both above and below, furnished with feathers to the middle: the top of the head, and neck, are of a deep dull red: the throat, fore part of the neck, and breast, are the colour of a deep ruby or carbuncle: the rest of the body velvet black: the wings brown: and the tail of a deep gilded rusous colour.

PLACE.

This came from Cayenne, where it is very rare.

RACKET-TAILED H. B.

L'Oiseau-mouche à raquettes, Buf. ois. vi. p. 23.

DESCRIPTION.

HIS bird, from the bill to the end of the tail, is two inches and a half: the upper part of the body green gold: the

throat of a rich emerald green: wings and tail brown: the shafts of all the tail feathers are very broad, and of a rusous white: but what characterises this bird is, having the two middle tail feathers elongated ten lines at least beyond the real tail, but without webs; only at the point of each of these naked shafts is a tust of a fan shape; giving the appearance of a racquet.

The above described from the cabinet of M. Mauduit, but its native place not mentioned.

CRESTED BROWN H. B.

Br. Muf.

Description.

SIZE of the last: colour of the plumage dusky pale brown: quills and tail darkest: crest fashioned as in the last bird; but wholly of a glossy bright blue.

Described from a specimen in the British Museum, but whether allied to the last uncertain: from whence it came is likewise unknown.

TUFTED-NECK+D H. B.

L'Oiseau-mouche, dit le Hupecol de Cayenne, Pl. enl. 640. f. 3.

Lew. Mus.

Description.

Male.

HIS is a most elegant as well as fingular species: it is scarcely so big as the red-throated: the head, and all the upper parts of the body, are of a green gold: across the rump is a white band: beyond this, to the end of the tail, it is brown, with a bronzed appearance; but the inner webs of the feathers are rufous: the under parts of the body are of a gilded green brown; and the lower part of the belly white: on the top of the head is a rufous crest, pretty long: but what characterises the bird, is a tuft on each fide of the neck, beneath the ears, confifting of feven or eight feathers of different lengths, the longest above half an inch, the feathers of which are rather narrow, of a rufous colour, and at the end of each there is a shining green spot; these feathers the bird is faid to erect like a ruff, or depress them, at will; and when the bird is at rest they are in the last state, falling on the neck: the throat, and fore part of the neck, are of a rich green

	5	
,		
,		

Ruff neckd Kumming-Birds.

green gold colour; and, if the eye is placed beneath, appear brown, and without gloss.

The female has neither the creft nor the ruff as the male: the band on the rump, and the throat, are both inclined to rufous: the rest of the parts beneath are likewise rusous, with a cast of green: the upper part of the head, and the back, are, like the male, of a gold green.

Inhabits Cayenne.

I ENGTH three inches and a quarter. Bill three quarters of an inch, strait, and black: crown of the head glossy green gold, inclining to olive: upper parts of the body pale cinnamon: between the wings a greenish gloss: throat and breast of a most resplendent glowing ruby-colour, in different shades appearing glossed with olive green; on the sides of the neck deepest; several of these feathers are elongated on the sides of the neck, and appear to be moveable, as in the last species: the wing coverts are of a dusky greenish colour: quills purplish brown: the lower part of the breast, and beginning of the belly, dirty reddish white: lower belly, and vent, pale cinnamon: tail in general glossy cinnamon; the feathers of it remarkably broad for the length, the two middle ones being sull half an inch, the other lessening in proportion; all of them tend to a point at the end, and are black down the middle, and at the tips: legs black.

The female is of the fame fize, but is green gold on the upper part of the body, instead of cinnamon: on the throat are spots only of the glowing ruby-colour: breast, and vent, as in the other: the tail feathers likewise correspond in colour and make, but each of the feathers, except the two middle ones, has a white spot FEMALE.

Marcgrave's fecond Humming-bird, Will. orn. p. 231. No 2.

DESCRIPTION.

THE body is very finall: the length of the bird four inches and a half. The bill eleven lines, and black: the forehead is blue, with a tinge of bright violet: the top of the head deep green gold: the rest of the body bright green gold, except the thighs, which are brown, and the vent, which is white: quills violet brown: tail steel black, and a little forked: legs seathered to the toes; the colour brown, with whitish tips: toes brown.

PLACE.

Inhabits Brafil.

← ALL-GREEN H. B. L'orvert, Buf. oif. vi. p. 17. All-green Humming-bird, Edw. glean. t. 360. f. 1?

Description.

THIS, Buffon observes, is above all admirable for the very great brilliancy of its plumage; in some lights it appearing pure gold, in others green gold of the highest lustre: the plumage is thus interchanged as far as the wings: the tail is of a polished steely

* This is nearly in the fame latitude N. as the red-throated species is found to migrate.

brown:

brown: and the belly white. This bird is very small, not more than two inches in length.

Edwards's all-green Humming-bird above mentioned, cannot be far different; the fize of it is very small, and the lustre as brilliant; but he observes that the belly is blueish beneath, and does not hint one word of any white about it.

It must be owned, that these two last seem to differ in the colour of the plumage, but perhaps this may arise from their being of opposite sexes. I have, in my collection, a bird which I take to be the above: the length is two inches: the upper parts are green gold: the under, from chin to vent, white: quills and tail blue black; the last a trisle forked: bill and legs black.

This I had from Tobago.

Linnæus places it among the fynonyma of his Mellifugus; but in the Museum Adolphi, which he quotes likewise, this last is mentioned as a large species *.

Least Humming-bird, Sloane Jam. ii. p. 307. N° 38.—Edw. ii. t. 105. the female.—Brown Jam. p. 475. the female.

DESCRIPTION.

HIS is by much the least of all the species: small indeed, since it is exceeded, both in weight and dimensions, by more than one species of Bees! Sir Hans Sloane observes, that it weighs no more than twenty grains when fresh killed: the total length is one inch and a quarter. The bill is black; three lines and a half in length: the upper parts of the head and body are of a greenish gilded brown, in some lights appearing reddish: the under parts are greyish white: the wings are violet brown: the tail of a blueish black, with a gloss of polished metal; but the outer feather but one, on each side, is grey from the middle to the tip; and the outer one wholly grey: legs and claws brown.

FEMALE.

The female is less than the male: the whole upper side of a dirty brown, with a slight gloss of green: the under parts of a dirty white.

PLACE.

These birds are found in various parts of South America, and the islands contiguous thereto. I have received this species from Jamaica.
